INTRODUCTION

The following protocols have been developed and approved by the Denver Metro EMS Medical Directors (DMEMSDM) group. These protocols define the standard of care for EMS providers in the Denver Metropolitan area, and delineate the expected practice, actions, and procedures to be followed.

No protocol can account for every clinical scenario encountered, and the DMEMSDM recognize that in rare circumstances deviation from these protocols may be necessary and in a patient’s best interest. Variance from protocol should always be done with the patient’s best interest in mind and backed by documented clinical reasoning and judgment. Whenever possible, prior approval by direct verbal order from base station physician is preferred. Additionally, all variance from protocol should be documented and submitted for review by agency Medical Director in a timely fashion.

The protocols are presented in an algorithm format. An algorithm is intended to reflect real-life decision points visually. An algorithm has certain limitations, and not every clinical scenario can be represented. Although the algorithm implies a specific sequence of actions, it may often be necessary to provide care out of sequence from that described in the algorithm if dictated by clinical needs. An algorithm provides decision-making support, but need not be rigidly adhered to and is no substitute for sound clinical judgment.

In order to keep protocols as uncluttered as possible, and to limit inconsistencies, individual drug dosing has not been included in the algorithms. It is expected the EMTs will be familiar with standard drug doses. Drug dosages are included with the medications section of the protocols as a reference.

If viewing protocol in an electronic version, it will be possible to link directly to a referenced protocol by clicking on the hyperlink, which is underlined.

PROTOCOL KEY

Boxes without any color fill describe actions applicable to all levels of EMT. Boxes with orange fill are for actions for EMT-Intermediate level or higher, and blue-filled boxes are for EMT-paramedic level. When applicable, actions requiring base contact are identified in the protocol.

Teaching points deemed sufficiently important to be included in the protocol are separated into grey-filled boxes with a double line border:

- Teaching points

PEDIATRIC PROTOCOLS

For the purposes of these clinical care protocols, pediatric patients are those < 12 years of age, except where identified in a specific protocol.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
CONFIDENTIALITY

A. The patient-physician relationship, the patient-registered nurse relationship, and the patient-EMT relationship are recognized as privileged. This means that the physician, nurse, or EMT may not testify as to confidential communications unless:
   1. The patient consents
   2. The disclosure is allowable by law (such as Medical Board or Nursing Board proceedings, or criminal or civil litigation in which the patient’s medical condition is in issue)

B. The prehospital provider must keep the patient’s medical information confidential. The patient likely has an expectation of privacy, and trusts that personal, medical information will not be disclosed by medical personnel to any person not directly involved in the patient’s medical treatment.
   1. Exceptions
      i. The patient is not entitled to confidentiality of information that does not pertain to the medical treatment, medical condition, or is unnecessary for diagnosis or treatment.
      ii. The patient is not entitled to confidentiality for disclosures made publicly.
      iii. The patient is not entitled to confidentiality with regard to evidence of a crime.

C. Additional Considerations:
   1. Any disclosure of medical information should not be made unless necessary for the treatment, evaluation or diagnosis of the patient.
   2. Any disclosures made by any person, medical personnel, the patient, or law enforcement should be treated as limited disclosures and not authorizing further disclosures to any other person.
   3. Any discussions of prehospital care by and between the receiving hospital, the crewmembers in attendance, or at in-services or audits are done strictly for educational or performance improvement purposes. Further disclosures are not authorized.
   4. Radio communications should not include disclosure of patient names.
   5. This procedure does not preclude or supersede your agency’s HIPAA policy and procedures.
0003 GENERAL GUIDELINES: CONSENT

CONSENT

General Principles: Adults

A. An adult in the State of Colorado is 18 years of age or older.
B. Every adult is presumed capable of making medical treatment decisions. This includes the right to make "bad" decisions that the prehospital provider believes are not in the best interests of the patient.
C. A person is deemed to have decision-making capacity if he/she has the ability to provide informed consent, i.e., the patient:
   1. Understands the nature of the illness/injury or risk of injury/illness
   2. Understands the possible consequences of delaying treatment and/or refusing transport
   3. Given the risks and options, the patient voluntarily refuses or accepts treatment and/or transport.
D. A call to 9-1-1 itself does not prevent a patient from refusing treatment. A patient may refuse medical treatment (IVs, oxygen, medications), but you should try to inform the patient of the need for therapies, offer again, and treat to the extent possible.
E. The odor of alcohol on a patient's breath does not, by itself, prevent a patient from refusing treatment.
F. Implied Consent: An unconscious adult is presumed to consent to treatment for life-threatening injuries/illnesses.
G. Involuntary Consent: a person other than the patient in rare circumstances may authorize Consent. This may include a court order (guardianship), authorization by a law enforcement officer for prisoners in custody or detention, or for persons under a mental health hold or commitment who are a danger to themselves or others or are gravely disabled.

Procedure: Adults

A. Consent may be inferred by the patient's actions or by express statements. If you are not sure that you have consent, clarify with the patient or CONTACT BASE. This may include consent for treatment decisions or transport/destination decisions.
B. Determining whether or not a patient has decision-making capacity to consent or refuse medical treatment in the prehospital setting can be very difficult. Every effort should be made to determine if the patient has decision-making capacity, as defined above.
C. For patients who do not have decision-making capacity, CONTACT BASE.
D. If the patient lacks decision-making capacity and the patient's life or health is in danger, and there is no reasonable ability to obtain the patient's consent, proceed with transport and treatment of life-threatening injuries/illnesses. If you are not sure how to proceed, CONTACT BASE.
E. For patients who refuse medical treatment, if you are unsure whether or not a situation of involuntary consent applies, CONTACT BASE.

General Principles: Minors

A. A parent, including a parent who is a minor, may consent to medical or emergency treatment of his/her child. There are exceptions:
   1. Neither the child nor the parent may refuse medical treatment on religious grounds if the child is in imminent danger as a result of not receiving medical treatment, or when the child is in a life-threatening situation, or when the condition will result in serious handicap or disability.
   2. The consent of a parent is not necessary to authorize hospital or emergency

0003 GENERAL GUIDELINES: CONSENT

health care when an EMT in good faith relies on a minor's consent, if the minor is at least 15 years of age and emancipated or married.

3. Minors may seek treatment for abortion, drug addiction, and venereal disease without consent of parents. Minors > 15 years may seek treatment for mental health.

B. When in doubt, your actions should be guided by what is in the minor's best interests and base contact.

Procedure: Minors

A. A parent or legal guardian may provide consent to or refuse treatment in a non-life-threatening situation.

B. When the parent is not present to consent or refuse:
   1. If a minor has an injury or illness, but not a life-threatening medical emergency, you should attempt to contact the parent(s) or legal guardian. If this cannot be done promptly, transport.
   2. If the child does not need transport, they can be left at the scene in the custody of a responsible adult (e.g., teacher, social worker, grandparent). It should only be in very rare circumstances that a child of any age is left at the scene if the parent is not also present.
   3. If the minor has a life-threatening injury or illness, transport and treat per protocols. If the parent objects to treatment, CONTACT BASE immediately and treat to the extent allowable, and notify police to respond and assist.
PHYSICIAN AT THE SCENE/MEDICAL DIRECTION

Purpose

A. To provide guidelines for prehospital personnel who encounter a physician at the scene of an emergency.

General Principles

A. The prehospital provider has a duty to respond to an emergency, initiate treatment, and conduct an assessment of the patient to the extent possible.
B. A physician who voluntarily offers or renders medical assistance at an emergency scene is generally considered a "Good Samaritan." However, once a physician initiates treatment, he/she may feel a physician-patient relationship has been established.
C. Good patient care should be the focus of any interaction between prehospital care providers and the physician.

Procedure

A. See algorithm below and sample note to physician at the scene

Special notes

A. Every situation may be different, based on the physician, the scene, and the condition of the patient.
B. CONTACT BASE when any question(s) arise.
Physician at the Scene/Medical Direction Note

NOTE TO PHYSICIANS ON INVOLVEMENT WITH EMS PROVIDERS

THANK YOU FOR OFFERING YOUR ASSISTANCE.

The prehospital personnel at the scene of this emergency operate under standard policies, procedures, and protocols developed by their Medical Director. The drugs carried and procedures allowed are restricted by law and written protocols.

After identifying yourself by name as a physician licensed in the State of Colorado and providing identification, you may be asked to assist in one of the following ways:

1. Offer your assistance or suggestions, but the prehospital care providers will remain under the medical control of their base physician, or
2. With the assistance of the prehospital care providers, talk directly to the base physician and offer to direct patient care and accompany the patient to the receiving hospital. Prehospital care providers are required to obtain an order directly from the base physician for this to occur.

THANK YOU FOR OFFERING YOUR ASSISTANCE DURING THIS EMERGENCY.

________________________________________  __________________________________
Medical Director                              Agency
0004 GENERAL GUIDELINES: PHYSICIAN AT THE SCENE/MEDICAL DIRECTION

PHYSICIAN AT THE SCENE/MEDICAL DIRECTION ALGORITHM

EMS arrives on scene

EMT attempts patient care

Physician reports on patient and relinquishes patient care

Provide care per protocol

Physician wants to help or is involved in or will not relinquish patient care

Prehospital provider identifies self and level of training

Physician willing to just help out

Provide general instructions and utilize physician assistance

Physician requests or performs care inappropriate or inconsistent with protocols

Shares Physician At The Scene/Medical Direction Note with physician and advise physician of your responsibility to the patient

Physician does not relinquish patient care and continues with care inconsistent with protocols

Contact Base for Medical Consult

Physician complies

Provide care per protocol

0005 GENERAL GUIDELINES: TERMINATION OF RESUSCITATION AND FIELD PRONOUNCEMENT GUIDELINES

Purpose

A. To provide guidelines for resuscitation and field pronouncement of patients in cardiac arrest in the prehospital setting

General Principles

A. Agency policy determines base contact requirements for patients for whom resuscitative efforts are being withheld.
B. Attempt resuscitation for all patients found pulseless and apneic, unless any of the following are present:
   1. Physician orders as specified on the Colorado Medical Orders for Scope of Treatment (MOST) form: "No CPR. Do Not Resuscitate/DNR/Allow Natural Death", present with the patient
   2. A valid CPR directive present with the patient
   3. Dependent lividity or rigor mortis
   4. Decomposition
   5. Decapitation
   6. Evidence of massive blunt head, chest, or abdominal trauma
   7. Third degree burns over more than 90% of the total body surface area

Termination of Resuscitation (TOR)

A. All cases described below require contact with a base physician to approve termination of resuscitation (TOR).

   1. Blunt Trauma Arrest:
      a. Contact Base for TOR if patient found apneic and pulseless and no response to BLS care including chest compressions and bag valve mask ventilations.

   2. Penetrating Trauma Arrest:
      a. Resuscitate and transport to a trauma facility.
         i. If time of arrest suspected to be > 10 minutes, and no signs of life or response to BLS care (as above), consider base contact for TOR.

   3. Medical Pulseless Arrest:
      a. Resuscitate according to Universal Pulseless Arrest Algorithm on scene (unless unsafe) until one of the following end-points met:
         i. Return of spontaneous circulation (ROSC).
         ii. No ROSC despite 15 minutes of provision of ALS care or BLS care with an AED. If shockable rhythm still present, continue resuscitation and transport to closest emergency department.
         iii. Contact base for TOR at any point if continuous asystole for at least 15 minutes in any patient despite adequate CPR with ventilation and no reversible causes have been identified.

      b. For BLS-only providers, contact Base for TOR when all of the following criteria met:
         i. No AED shock advised
         ii. No ROSC
         iii. Arrest unwitnessed by either EMS or bystanders
         iv. No bystander CPR before EMS arrival

      c. The following patients found pulseless and apneic warrant resuscitation efforts beyond 30 minutes and should be transported:
         i. Hypothermia
         ii. Drowning with hypothermia and submersion < 60 minutes
         iii. Pregnant patient with estimated gestational age ≥ 20 weeks

   4. After pronouncement, do not alter condition in any way or remove equipment (lines, tubes, etc.), as the patient is now a potential coroner’s case.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Advance Medical Directives

A. These guidelines apply to both adult and pediatric patients.
B. There are several types of advance medical directives (documents in which a patient identifies the treatment to be withheld in the event the patient is unable to communicate or participate in medical treatment decisions).
C. Some patients may have specific physician orders on a Colorado Medical Orders for Scope of Treatment (MOST) form. A MOST form order to withhold CPR or resuscitation should be honored by EMS.
D. Resuscitation may be withheld from, or terminated for, a patient who has a valid CPR Directive, Do Not Resuscitate Order (DNR), or other advance medical directive when:
   1. It is clear to the prehospital provider from the document that resuscitation is refused by the patient or by the patient's attending physician who has signed the document; and
   2. Base physician has approved withholding of or ceasing resuscitation.
E. Suspected suicide does not necessarily negate an otherwise valid CPR Directive, DNR order or other advanced medical directive. CONTACT BASE
F. The Colorado CPR Directive directs EMS providers to withhold CPR in the event of cardiac or respiratory arrest or malfunction.
   1. “Cardiopulmonary Resuscitation” (CPR) means measures to restore cardiac function or to support breathing in the event of cardiac or respiratory arrest or malfunction. “CPR” includes, but is not limited to, artificial ventilation, chest compression, delivering electric shock, placing tubes in the airway to assist breathing or other basic and advanced resuscitative therapies.
   2. CPR Directive bracelet or necklace may be used by an individual and shall be complied with in the same manner as a written CPR Directive.
   3. A signed CPR directive form that has been photocopied, scanned, faxed is valid.
G. A Living Will (“Declaration as to Medical or Surgical Treatment”) requires a patient to have a terminal condition, as certified in the patient's hospital chart by two physicians.
H. Other types of advance directives may be a "Durable Medical Power of Attorney," or "Health Care Proxy". Each of these documents can be very complex and require careful review and verification of validity and application to the patient's existing circumstances. Therefore, the consensus is that resuscitation should be initiated until a physician can review the document or field personnel can discuss the patient’s situation with the base physician. If there is disagreement at the scene about what should be done, CONTACT BASE for guidance.
I. Verbal DNR "orders" are not to be accepted by the prehospital provider. In the event family or an attending physician directs resuscitation be ceased, the prehospital provider should immediately CONTACT BASE. The prehospital provider should accept verbal orders to cease resuscitation only from the Base physician.
J. There may be times in which the prehospital provider feels compelled to perform or continue resuscitation, such as a hostile scene environment, family members adamant that "everything be done," or other highly emotional or volatile situations. In such circumstances, the prehospital provider should attempt to confer with the base for direction and if this is not possible, the prehospital provider must use his or her best judgment in deciding what is reasonable and appropriate, including transport, based on the clinical and environmental conditions, and establish base contact as soon as possible.

Additional Considerations:

A. Patients with valid DNR orders or advanced medical directives should receive supportive or comfort care, e.g. medication by any route, positioning and other measures to relieve pain and suffering. Also the use of oxygen, suction and manual treatment of an airway obstruction as needed for comfort.
B. Mass casualty incidents are not covered in detail by these guidelines. (See State Trauma Triage Algorithm).
C. If the situation appears to be a potential crime scene, EMS providers should disturb the scene as little as possible and communicate with law enforcement regarding any items that are moved or removed from the scene.
D. Mechanisms for disposition of bodies by means other than EMS providers and vehicles should be prospectively established in each county or locale.
   1. In all cases of unattended deaths occurring outside of a medical facility, the coroner should be contacted immediately.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0007 GENERAL GUIDELINES: PATIENT DETERMINATION: “PATIENT OR NO PATIENT”

General Guidelines

This protocol is intended to refer to individual patient contacts. In the event of a multiple party incident, such as a multi-vehicle collision, it is expected that a reasonable effort will be made to identify those parties with acute illness or injuries. Adult patients indicating that they do not wish assistance for themselves or dependent minors in such a multiple party incident do not necessarily require documentation as patients.

No protocol can anticipate every scenario and providers must use best judgment. When in doubt as to whether individual is a “patient”, err on the side of caution and perform a full assessment and documentation.

Decision-Making Capacity
(Must meet all criteria)

- Understands nature of illness or injury
- Understands consequences of refusal of care
- Not intoxicated with drugs or alcohol
- No criteria for a Mental Health Hold:
  - Not homicidal or suicidal
  - Not gravely disabled or psychotic
  - Not a danger to self or others

Individual meets definition of a Patient
(PCR Required)

Person does not meet definition of a patient, and does not require PCR or refusal of care

0008 GENERAL GUIDELINES: PATIENT NON-TRANSPORT OR REFUSAL

A person who has decision-making capacity may refuse examination, treatment and transport

Refer to 0003: GENERAL GUIDELINES: CONSENT for Decision-Making Capacity guidelines

Documentation Requirements for Refusal
- Confirm decision-making capacity
- EMS assistance offered and declined
- Risks of refusal explained to patient
- Patient understands risks of refusal
- Name of Base Station physician authorizing refusal of care unless standing order refusal
- Signed refusal of care against medical advice document, if possible
- Any minor with any complaint/injury is a patient and requires a PCR

Not a patient
(see Patient Determination)

Patient

Transport

No transport

Determine if Standing Order Refusal

Standing Order Refusal
No Base Contact required if ALL criteria met:
- 18 and older or 5 and older if parent/guardian on scene
- Patient has decision-making capacity

Contact Base If:
- < 5 years old
- < 18 years old unless parent/guardian on scene
- Base contact is recommended whenever, in the clinical judgement of the EMS provider, the patient is at high risk of deterioration without medical intervention

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0009 GENERAL GUIDELINES: EMERGENCY DEPARTMENT DIVERT AND ADVISORY

Purpose

• To provide a standard approach to ambulance diversion that is practical for field use
• To facilitate unobstructed access to hospital emergency departments for ambulance patients
• To allow for optimal destination policies in keeping with general EMS principles and Colorado State Trauma System Rules and Regulations

General Principles

A. *EMS*System, an internet-based tracking system, is used to manage diversion in the Denver Metro area
B. The State Trauma Triage Algorithms should be followed
C. The only time an ambulance can be diverted from a hospital is when that hospital is posted on EMS*System* as being on official divert (RED) status.
D. Overriding factors: the following are appropriate reasons for a paramedic to override ED Divert and, therefore, deliver a patient to an emergency department that is on ED divert:
   1. Cardiopulmonary arrest
   2. Imminent cardiopulmonary arrest
   3. Unmanageable airway emergencies
   4. Unstable trauma and burn patients transported to Level I and Level II Trauma Centers
   5. Patients meeting “Cardiac Alert” criteria (participating hospitals)
   6. Patients meeting “Stroke Alert” criteria (participating hospitals)
   7. Imminent delivery
E. Prehospital personnel should honor advisory categories, when possible, considering patient’s condition, travel time, and weather. Patients with specific problems that fall under an advisory category should be transported to a hospital not on that specific advisory when feasible.
F. There are several categories that are considered advisory (yellow) alert categories. These categories are informational only and should alert field personnel that a hospital listed as being on an advisory alert may not be able to optimally care for a patient that falls under that advisory category.
G. The following are advisory (yellow) categories recognized by the State. Individual facilities may not utilize these categories often, or ever:
   1. ICU (Intensive Care Unit)
   2. Psych (Psychiatric)
H. Zone saturation exists when all hospitals within that zone are on ED Divert.
I. A Zone Master is the designated hospital within a Zone responsible for determining and tracking hospital assignments when the zone is saturated.
J. When an ambulance is transporting a patient that the paramedic feels cannot go outside the zone due to patient acuity or other concerns, the paramedic should contact the Zone Master and request a destination assignment.
K. In general, patients contacted within a zone should be transported to an appropriate facility within the zone. Patients may be transported out of the primary zone at the paramedic’s discretion, if it is in the patient’s best interest or if the transport to an appropriate facility is shorter.
L. The zones, hospitals in each zone, Zone Masters, and the Zone Master contact phone numbers are listed on *EMS*System.

0010 GENERAL GUIDELINES: MANDATORY REPORTING OF ABUSE PATIENTS

Purpose

• To provide guidelines for the reporting of suspected abuse patients.

General Principles

• At-risk adult or pediatric patients who are suspected to be victims of abuse or exploitation, as defined in State Statute and Rule, should be reported in a manner consistent with agency guidelines/procedures.

0011 GENERAL GUIDELINES: FREE-STANDING EMERGENCY DEPARTMENTS AS EMS DESTINATION

Purpose

The term “free-standing emergency department” (FSED) may refer to both licensed emergency departments that accept EMS traffic as an extension of an affiliated hospital, as well as independent emergency departments unaffiliated with a hospital. The following recommendations apply to those FSEDs that accept EMS traffic as an extension of its affiliated hospital.

Recommendations

A. **Hemodynamically stable patients** may be **considered** for transport to a hospital-affiliated FSED with the following exceptions:
   1. No OB patients > 20 weeks estimated gestational age
   2. No trauma patients meeting RETAC trauma center destination guidelines.
   3. No alerts (e.g. STEMI, Stroke, Sepsis).
   4. No post-cardiac arrest patients with ROSC unless uncontrolled airway

B. When time and conditions allow, patients whom pre-hospital providers presume to require inpatient management may be transported to a hospital emergency department to avoid subsequent patient transfers.

Additional Considerations

A. It is understood that individual agency guidelines may vary due to unique geographic, clinical or environmental considerations, as well as individual EMS Medical Director and agency policy. Because FSEDs do not have obstetric services, cardiac catheterization labs or operating rooms, these conservative guidelines are provided by the Denver Metropolitan EMS Medical Directors. These recommendations are not intended to supersede individual agency policy and procedures.

B. Hospital-affiliated free-standing emergency departments accepting EMS traffic include:
   1. 84th Avenue Neighborhood Health Center (St. Anthony Hospital)
   2. Centennial Medical Plaza (The Medical Center of Aurora)
   3. Saddle Rock ER (The Medical Center of Aurora)
   4. Swedish Southwest ER (Swedish Medical Center)
   5. North Suburban Northwest ER (North Suburban Medical Center)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0012 GENERAL GUIDELINES: BASE CONTACT FOR PHYSICIAN CONSULTATION

Purpose
To explain the DMEMS Medical Directors' expectations regarding base physician contact.

General Principles
A. Base contact for physician consultation is not the same as emergency department pre-notification of patient arrival and handoff.

B. Base contact is used in multiple care scenarios including but not limited to; forewarning of unstable or complicated patients, patient refusal and medical consultation and discussion.

C. Good communication is critical to a smooth transition of care between the prehospital setting and the emergency department.

D. The DMEMS protocols function as standing order treatment guidelines and algorithms designed to reflect CDPHE Chapter 2 – Rules Pertaining to EMS Practice and Medical Director Oversight. Much of the scope of practice is also summarized in the 8010 Quick Reference for Procedures and Medications Allowed.

E. Throughout the protocol patient “BASE CONTACT” is used to signify the need for call in. These algorithm points are set and agreed upon by the DMEMSMD and reflect critical decision points in care where communication with physician support is expected.

F. As stated in the introduction the protocols are to be used as guidelines. Protocol cannot account for every patient scenario and deviation from protocol may at times be justified and in the patients best interest. The DMEMSMD place great faith in the training and expertise of our prehospital colleagues and therefore wide latitude is granted throughout the protocol.

Preferred Base Contact Times.
A. The DMEMSMD group feels strongly that access to medical consultation should be readily available at all times and should be utilized in the following circumstances:

   a. Any time “BASE CONTACT” is required or recommended per protocol.
   b. Unusual presentations or patient care situations not covered by set protocol and outside the scope of practice or comfort level of care by individual prehospital provider.
   c. Necessary deviation from protocol deemed to be in the best interest of the patient.
   d. For selected patient care refusals as indicated by 0008 General Guidelines: Patient Non-Transport or Refusal.
   e. During the care of critically ill patient who is not responding to protocol/algorithmic treatment.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0100 PROCEDURE PROTOCOL: OROTRACHEAL INTUBATION

Indications:

• Respiratory failure
• Absence of protective airway reflexes
• Present or impending complete airway obstruction
• Anticipated prolonged need for positive pressure ventilation

Contraindications:

• There are no absolute contraindications. However, in general the primary goals of airway management are adequate oxygenation and ventilation, and these should be achieved in the least invasive manner possible
  o Orotracheal intubation is associated with worse outcomes among pediatric patients and head injured patients when compared to BLS airway maneuvers. Therefore, it is relatively contraindicated in these populations
  o Intubation is associated with interruptions in chest compressions during CPR, which is associated with worse patient outcomes. Additionally, intubation itself has not been shown to improve outcomes in cardiac arrest

Technique:

1. Initiate BLS airway sequence
2. Suction airway and pre-oxygenate with BVM ventilations, if possible
3. Check equipment and position patient:
   a. If trauma: have assistant hold in-line spinal immobilization in neutral position
   b. If no trauma, sniffing position or slight cervical hyperextension is preferred
4. Perform laryngoscopy
   a. To improve laryngeal view, use right hand to manipulate larynx, or have assistant apply backwards, upwards, rightward pressure (BURP)
5. Place ETT. Confirm tracheal location and appropriate depth and secure tube
   a. Correct tube depth may be estimated as 3 times the internal diameter of tube at teeth or gums (e.g: 7.0 ETT is positioned at 21 cm at teeth)
6. Confirm and document tracheal location by:
   a. ETCO2
   b. Presence and symmetry of breath sounds
   c. Rising SpO2
   d. Other means as needed
7. Ventilate with BVM. Assess adequacy of ventilations
8. During transport, continually reassess ventilation, oxygenation and tube position with continuous ETCO2 and SpO2

Precautions:

• Ventilate at age-appropriate rates. Do not hyperventilate
• If the intubated patient deteriorates, think “DOPE”
  o Dislodgement
  o Obstruction
  o Pneumothorax
  o Equipment failure (no oxygen)
• Reconfirm and document correct tube position after moving patient and before disconnecting from monitor in ED
• Unsuccessful intubation does not equal failed airway management. Many patients cannot be intubated without paralytics. Use King airway or BVM ventilations if 2 attempts at intubation unsuccessful.

0110 PROCEDURE PROTOCOL: NASOTRACHEAL INTUBATION

**Indications:**

- Age 12 years and older spontaneously breathing patient with indication for intubation who cannot tolerate either supine position or laryngoscopy
- Present or impending airway obstruction
- Lack of protective airway reflexes
- Anticipated prolonged need for positive pressure ventilation

**Contraindications:**

- Apnea
- Severe mid-face trauma

**Technique:**

1. Initiate BLS airway sequence
2. Suction airway and pre-oxygenate with BVM ventilations, if possible
3. Check equipment, choose correct ETT size (usually 7.0 in adult, limit is size of naris)
4. Position patient with head in midline, neutral position
5. If trauma: cervical collar may be in place, or assistant may hold in-line stabilization in neutral position
6. If no trauma, patient may be sitting upright
7. Administer phenylephrine nasal drops in each nostril
8. Lubricate ETT with Lidocaine jelly or other water-soluble lubricant
9. With gentle steady pressure, advance the tube through the nose to the posterior pharynx. Use the largest nostril. Abandon procedure if significant resistance is felt
10. Keeping the curve of the tube exactly in midline, continue advancing slowly
11. There will be slight resistance just before entering trachea. Wait for an inspiratory effort before final passage through cords. Listen for loss of breath sounds
12. Continue advancing tube until air is definitely exchanging through tube, then advance 2 cm more and inflate cuff
13. Note tube depth and tape securely
14. Confirm and document endotracheal location by:
   a. ETCO₂
   b. Presence and symmetry of breath sounds
   c. Rising SpO₂
   d. Other means as needed
15. Ventilate with BVM. Assess adequacy of ventilations
16. During transport, continually reassess ventilation, oxygenation and tube position with continuous ETCO₂ and SpO₂

**Precautions:**

- Before performing BNTI, consider if patient can be safely ventilated with non-invasive means such as CPAP or BVM
- Ventilate at age-appropriate rates. Do not hyperventilate
- If the intubated patient deteriorates, think “DOPE”
  o Dislodgement
  o Obstruction
  o Pneumothorax
  o Equipment failure (no oxygen)
- Reconfirm and document correct tube position after moving patient and before disconnecting from monitor in ED
- Blind nasotracheal intubation is a very gentle technique. The secret to success is perfect positioning and patience.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0120 PROCEDURE PROTOCOL: PERCUTANEOUS CRICOTHYROTOMY

Introduction:

• Percutaneous cricothyrotomy is a difficult and hazardous procedure that is to be used only in extraordinary circumstances as defined below. The reason for performing this procedure must be documented and submitted for review to the EMS Medical Director within 24 hours.

Indications:

• A life-threatening condition exists AND advanced airway management is indicated, AND adequate oxygenation and ventilation cannot be accomplished by other less invasive means.

Contraindications:

• Anterior neck hematoma is a relative contraindication
• Age less than 12 years old is a relative contraindication

Technique:

1. Prepare skin using aseptic solution
2. Position the patient in a supine position, with in-line spinal immobilization if indicated. If cervical spine injury not suspected, neck extension will improve anatomic view
3. Perform cricothyrotomy according to manufacturer’s instructions for selected device
4. Confirm and document tube placement by:
   a. ETCO$_2$
   b. Breath sounds
   c. Rising pulse oximetry
   d. Other means as needed
5. Ventilate with BVM assessing adequacy of ventilation
6. Observe for subcutaneous air, which may indicate tracheal injury or extra- tracheal tube position
7. Secure tube with tube ties or device
8. Continually reassess ventilation, oxygenation and tube placement

Precautions:

• Success of procedure is dependent on correct identification of cricothyroid membrane
• Bleeding will occur, even with correct technique. Straying from the midline is dangerous and likely to cause hemorrhage

Introduction:

- Surgical cricothyrotomy is a difficult and hazardous procedure that is to be used only in extraordinary circumstances as defined below. The reason for performing this procedure must be documented and submitted for review to the EMS Medical Director within 24 hours. Surgical cricothyrotomy is to be performed only by paramedics trained in this procedure.
- An endotracheal tube introducer ("bougie") facilitates this procedure and has the advantage of additional confirmation of tube position and ease of endotracheal tube placement. If no bougie is available the procedure may be performed without a bougie by introducing endotracheal tube or tracheostomy tube directly into cricothyroid membrane.
- Given the rarity and relative unfamiliarity of this procedure it may be helpful to have a medical consult on the phone during the procedure. Consider contacting base for all cricothyroidotomy procedures. Individual Medical Directors may mandate base contact before initiating the procedure. Individual agency policy and procedures apply and providers are responsible for knowing and following these policies.

Indications:

- A life-threatening condition exists AND advanced airway management is indicated AND you are unable to establish an airway or ventilate the patient by any other means.

Contraindications:

- Surgical cricothyrotomy is contraindicated in patients less than 12 years of age for anatomic reasons.

Technique:

1. Position the patient supine, with in-line spinal immobilization if indicated. If cervical spine injury not suspected, neck extension will improve anatomic view.
2. Using an aseptic technique (betadine/alcohol wipes), cleanse the area.
3. Standing on the left side of the patient, stabilize the larynx with the thumb and middle finger of your left hand, and identify the cricothyroid membrane, typically 4 finger-breadths below mandible.
4. Using a scalpel, make a 3 cm centimeter vertical incision 0.5 cm deep through the skin and fascia, over the cricothyroid membrane. With finger, dissect the tissue and locate the cricothyroid membrane.
5. Make a horizontal incision through the cricothyroid membrane with the scalpel blade oriented caudal and away from the cords.
6. Insert the bougie curved-tip first through the incision and angled towards the patient's feet.
   a. If no bougie available, use tracheal hook instrument to lift caudal edge of incision to facilitate visualization and introduction of ETT directly into trachea and skip to # 9.
7. Advance the bougie into the trachea feeling for "clicks" of tracheal rings and until "hangup" when it cannot be advanced any further. This confirms tracheal position.
8. Advance a 6-0 endotracheal tube over the bougie and into the trachea. It is very easy to place tube in right mainstem bronchus, so carefully assess for symmetry of breath sounds. Remove bougie while stabilizing ETT ensuring it does not become dislodged.
9. Ventilate with BVM and 100% oxygen.
10. Confirm and document tracheal tube placement as with all advanced airways: ETCO₂ as well as clinical indicators e.g.: symmetry of breath sounds, rising pulse oximetry, etc.
11. Secure tube with ties.
12. Observe for subcutaneous air, which may indicate tracheal injury or extra- tracheal tube position.
13. Continually reassess ventilation, oxygenation and tube placement.

Precautions:

- Success of procedure is dependent on correct identification of cricothyroid membrane.
- Bleeding will occur, even with correct technique. Staying from the midline is dangerous and likely to cause hemorrhage from the carotid or jugular vessels, or their branches.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0130 PROCEDURE PROTOCOL: KING AIRWAY

Indications:
• Rescue airway if unable to intubate a patient in need of airway protection
• Primary airway if intubation anticipated to be difficult and rapid airway control is necessary
• Primary airway in pulseless arrest, when attempts at intubation are likely to interrupt CPR
• Designated advanced airway for EMTs

Contraindications:
• Intact gag reflex
• Caustic ingestion

Technique:
1. Initiate BLS airway sequence
2. Select proper size King airway based on patient height:
   a. 35” to 45” tall = #2  
   b. 41” to 51” tall = #2.5  
   c. 4’ to 5’ tall = #3  
   d. 5’-6’ tall = #4  
   e. Greater than 6’ tall = #5
3. Assemble equipment, note correct volume for inflation marked on tube itself, test balloon for leaks, lubricate posterior aspect distal tip with water-soluble lubricant (included)
4. Suction airway and pre-oxygenate with BVM ventilations, if possible
5. If trauma: have assistant hold in-line spinal immobilization in neutral position
6. If no trauma, sniffing position or slight cervical hyperextension is preferred
7. Hold King tube in dominant hand at the connector. With other hand, open mouth and lift chin
8. Rotate King tube so blue index line is facing corner of mouth
9. Introduce tip into mouth and advance airway behind tongue into the hypopharynx
10. As tube passes tongue, rotate King so that blue index line is again facing the chin
11. Without excessive force, advance King so that base is aligned with teeth or gums
12. Using supplied syringe, inflate cuff balloon with correct volume of air (marked on King tube):
   a. Size 2 = 30 mL  
   b. Size 2.5 = 35 mL  
   c. Size 3 = 50 mL  
   d. Size 4 = 70 mL  
   e. Size 5 = 80 mL
13. Attach bag to King and begin ventilating patient. While bagging, slowly and slightly withdraw King until ventilations are easy and chest rise is adequate
14. Confirm tube placement by auscultation, chest movement, and ETCO₂
15. Monitor patient for vomiting and aspiration
16. Continuously monitor ETCO₂, SpO₂, vital signs

Precautions:
1. If patient < 4’ tall, an appropriately sized pediatric King tube must be used.
2. Use with caution in patients with broken teeth, which may lacerate balloon
3. Use with caution in patients with known esophageal disease
4. Do not remove a properly functioning King tube in order to attempt intubation

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0140 PROCEDURE PROTOCOL: CONTINUOUS POSITIVE AIRWAY PRESSURE (CPAP)

Indications:
- Symptomatic patients with moderate-to-severe respiratory distress as evidenced by at least two (2) of the following:
  - Rales (crackles)
  - Dyspnea with hypoxia (SpO2 less than 90% despite O2)
  - Dyspnea with verbal impairment – i.e. cannot speak in full sentences
  - Accessory muscle use
  - Respiratory rate greater than 24/minute despite O2
  - Diminished tidal volume

Contraindications:
- Respiratory or cardiac arrest
- Systolic BP less than 90mmHg
- Lack of airway protective reflexes
- Significant altered level of consciousness such that unable to follow verbal instructions or signal distress
- Vomiting or active upper GI bleed
- Suspected pneumothorax
- Trauma
- Patient size or anatomy prevents adequate mask seal

Technique:
1. Place patient in a seated position and explain the procedure to him or her
2. Assess vital signs (BP, HR, RR, SpO2, and ETCO2)
3. Apply the CPAP mask and secure with provided straps, progressively tightening as tolerated to minimize air leak
4. Operate CPAP device according to manufacturer specifications
5. Start with the lowest continuous pressure that appears to be effective. Adjust pressure following manufacturer instructions to achieve the most stable respiratory status utilizing the signs described below as a guide
6. Monitor patient continuously, record vital signs every 5 minutes.
7. Assess patient for improvement as evidenced by the following:
   a. Reduced dyspnea
   b. Reduced verbal impairment, respiratory rate and heart rate
   c. Increased SpO2
   d. Stabilized blood pressure
   e. Appropriate ETCO2 values and waveforms
   f. Increased tidal volume
8. Observe for signs of deterioration or failure of response to CPAP:
   a. Decrease in level of consciousness
   b. Sustained or increased heart rate, respiratory rate or decreased blood pressure
   c. Sustained low or decreasing SpO2 readings
   d. Rising ETCO2 levels or other ETCO2 evidence of ventilatory failure
   e. Diminished or no improvement in tidal volume

Precautions:
- Should patient deteriorate on CPAP:
  o Troubleshoot equipment
  o Consider endotracheal intubation
  o Assess need for possible chest decompression due to pneumothorax
  o Assess for possibility of hypotension due to significantly reduced preload from positive pressure ventilation
- In-line nebulized medications may be given during CPAP as indicated and in accordance with manufacturer guidelines
- Some fixed pressure CPAP devices do not have FiO2 adjustment and will only administer up to 30% oxygen. If no improvement in oxygenation with a fixed pressure CPAP device consider adding supplemental oxygen.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0150 PROCEDURE PROTOCOL: CAPNOGRAPHY

Indications:
- MANDATORY: to rule out esophageal intubation and confirm endotracheal tube position in all intubated patients.
- To identify late endotracheal tube dislodgement
- To monitor ventilation and perfusion in any ill or injured patient

Contraindications:
- None

Technique:
1. In patient with ETT or advanced airway: place ETCO₂ detector in-line between airway adaptor and BVM after airway positioned and secured
2. Patients without ETT or advanced airway in place: place ETCO₂ cannula on patient. May be placed under CPAP or NRB facemask
3. Assess and document both capnography waveform and ETCO₂ value

Precautions:
1. To understand and interpret capnography, remember the 3 determinants of ETCO₂:
   a. Alveolar ventilation
   b. Pulmonary perfusion
   c. Metabolism
2. Sudden loss of ETCO₂:
   a. Tube dislodged
   b. Circuit disconnected
   c. Cardiac arrest
3. High ETCO₂ (> 45)
   a. Hypoventilation/CO₂ retention
4. Low ETCO₂ (< 25)
   a. Hyperventilation
   b. Low perfusion: shock, PE, sepsis
5. Cardiac Arrest:
   a. In low-pulmonary blood flow states, such as cardiac arrest, the primary determinant of ETCO₂ is blood flow, so ETCO₂ is a good indicator of quality of CPR
   b. If ETCO₂ is dropping, change out person doing chest compression
   c. In cardiac arrest, if ETCO₂ not > 10 mmHg after 20 minutes of good CPR, this likely reflects very low CO₂ production (dead body) and is a 100% predictor of mortality

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0160 PROCEDURE PROTOCOL: SULLYHORIZED CARDIOVERSION

Unstable tachyarrhythmia with a pulse

Check:
- O₂ via NRB facemask
- Functioning IV line
- Suction
- Advanced airway equipment ready

Sedate with benzodiazapine whenever possible

Perform Synchronized Cardioversion
- Use 200 Joules biphasic in adults and 1-2 Joules/kg in children < 12 years old

Continue treatment according to Tachycardia with a Pulse protocol

Precautions:
- If rhythm is AV nodal reentrant tachycardia (AVNRT, historically referred to as “PSVT”) it is preferred to attempt a trial of adenosine prior to electrical cardioversion, even if signs of poor perfusion are present, due to rapid action of adenosine
- If defibrillator does not discharge in “synch” mode, then deactivate “synch” and reattempt
- If sinus rhythm achieved, however briefly, then dysrhythmia resumes immediately, repeated attempts at cardioversion at higher energies are unlikely to be helpful. First correct hypoxia, hypovolemia, etc. prior to further attempts at cardioversion
- If pulseless, treat according to Universal Pulseless Arrest Algorithm
- Chronic atrial fibrillation is rarely a cause of hemodynamic instability, especially if rate is < 150 bpm. First correct hypoxia, hypovolemia, before considering cardioversion of chronic atrial fibrillation, which may be difficult, or impossible and poses risk of stroke
- Sinus tachycardia rarely exceeds 150 bpm in adults or 220 bpm in children < 8 years and does not require or respond to cardioversion. Treat underlying causes.
- Transient dysrhythmias or ectopy are common immediately following cardioversion and rarely require specific treatment other than supportive care

Paramedic

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0170 PROCEDURE PROTOCOL: TRANSCUTANEOUS CARDIAC PACING

Indications
1. Symptomatic bradyarrhythmias (includes A-V block) not responsive to medical therapy

Precautions
1. Conscious patient will experience discomfort; consider sedation with benzodiazepine if blood pressure allows.

Contraindications
1. Pacing is contraindicated in pulseless arrest.

Technique
1. Apply electrodes as per manufacturer specifications: (−) left anterior, (+) left posterior.
2. Turn pacer unit on.
3. Set initial current to 40 mAmps.
4. Select pacing rate at 80 beats per minute (BPM)
5. Start pacing unit.
6. Confirm that pacer senses intrinsic cardiac activity by adjusting ECG size.
7. Increase current 10 mAmps every 10-15 seconds until capture or 200 mAmps (usually captures around 100 mAmps).
8. If there is electrical capture, check for femoral pulse.
9. If no capture occurs with maximum output, discontinue pacing and resume ACLS.

Complications
1. Ventricular fibrillation and ventricular tachycardia are rare complications, but follow appropriate protocols if either occur.
2. Pacing is rarely indicated in patients under the age of 12 years.
3. Muscle tremors may complicate evaluation of pulses, femoral pulse may be more accurate.
4. Pacing may cause diaphragmatic stimulation and apparent hiccups.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0180 PROCEDURE PROTOCOL: THERAPEUTIC INDUCED HYPOTHERMIA AFTER CARDIAC ARREST

2025: Adult Post-Resuscitation Care Following Pulseless Arrest with ROSC

Initiate therapeutic hypothermia if there is no contraindication

TIH Procedure:
1. Check patient temperature, if possible
2. Give 30 mL/kg (up to 2 liters) ice-cold (4°C) normal saline bolus as a rapid infusion AND/OR place ice packs to neck, axillae, groin
3. Treat shivering with opioid IV/IO
4. If pulses lost after initiation of TIH, follow universal pulseless arrest algorithm and continue cooling
5. If hypotensive with poor perfusion consider vasopressor infusion

Transport to a hospital with TIH program and capacity for coronary intervention

Return of spontaneous circulation (ROSC) criteria:
- Pulse and measurable blood pressure
- Increase in ETCO₂ on capnography

Contraindications to TIH:
- Purposeful response to painful stimuli
- Age < 12 years
- Active bleeding
- Traumatic arrest
- Definite pregnancy
- Temperature < 34°C (93.2°F) or suspected hypothermia

Document:
- Time of arrest (or time last seen normal)
- Witnessed vs. unwitnessed arrest
- Initial rhythm shockable vs. non-shockable
- Bystander CPR given
- Time of ROSC
- GCS after ROSC
- Initial temperature if TIH patient

Consider and Contact Base for Other Indications For Cooling:
- Drowning
- Hanging or asphyxiation
- Hyperthermia

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Indications:
A. Physical restraint of patients is permissible and encouraged if the patient poses a danger to him or herself or to others. Only reasonable force is allowable, i.e., the minimum amount of force necessary to control the patient and prevent harm to the patient or others. Try alternative methods first (e.g., verbal de-escalation should be used first if the situation allows).

B. Paramedic: Consider pharmacological treatment (sedation) of agitation in patients that require transport and are behaving in a manner that poses a threat to him or herself or others.
1. See Agitated/Combative Patient Protocol: (The term “chemical restraint” is no longer preferred)

C. Restraints may be indicated for patients who meet the following criteria:
1. A patient who is significantly impaired (e.g. intoxication, medical illness, injury, psychiatric condition, etc) and lacks decision-making capacity regarding his or her own care.
2. A patient who exhibits violent, combative or uncooperative behavior who does not respond to verbal de-escalation.
3. A patient who is suicidal and considered to be a risk for behavior dangerous to his or herself or to healthcare providers.
4. A patient who is on a mental health hold.

Precautions:
A. When appropriate, involve law enforcement
B. Restraints shall be used only when necessary to prevent a patient from seriously injuring him or herself or others (including the ambulance crew), and only if safe transportation and treatment of the patient cannot be accomplished without restraints. They may not be used as punishment, or for the convenience of the crew.
C. Any attempt to restrain a patient involves risk to the patient and the prehospital provider. Efforts to restrain a patient should only be done with adequate assistance present.
D. Be sure to evaluate the patient adequately to determine his or her medical condition, mental status and decision-making capacity.
E. Do not use hobble restraints and do not restrain the patient in the prone position or any position that is impairing the airway or breathing.
F. Search the patient for weapons.
G. Handcuffs are not appropriate medical restraints and should only be placed by law enforcement personnel. See Handcuff Protocol.

Technique:
A. Treat the patient with respect. Attempts to verbally reassure or calm the patient should be done prior to the use of restraints. To the extent possible, explain what is being done and why.
B. Have all equipment and personnel ready (restraints, suction, a means to promptly remove restraints).
C. Use assistance such that, if possible, 1 rescuer handles each limb and 1 manages the head or supervises the application of restraints.
D. Apply restraints to the extent necessary to allow treatment of, and prevent injury to, the patient. Under-restraint may place patient and provider at greater risk.
E. After application of restraints, check all limbs for circulation. During the time that a patient is in restraints, continuous attention to the patient’s airway, circulation and vital signs in mandatory. A restrained patient may never be left unattended.

Documentation
Document the following in all cases of restraint:
A. Description of the facts justifying restraint
B. Efforts to de-escalate prior to restraint
C. Type of restraints used
D. Condition of the patient while restrained, including reevaluations during transport

Complications:
A. Aspiration: continually monitor patient’s airway
B. Nerve injury: assess neurovascular status of patient’s limbs during transport
C. Complications of medical conditions associated with need for restraint
1. Patients may have underlying trauma, hypoxia, hypoglycemia, hyperthermia, hypothermia, drug ingestion, intoxication or other medical conditions
D. Excited Delirium Syndrome. This is a life-threatening medical emergency. These patients are truly out of control. They will have some or all of the following symptoms: paranoia, disorientation, hyper-aggression, hallucination, tachycardia, increased strength, and hyperthermia.

Approved by Denver Metro EMS Medical Directors July 1, 2013. Next review January 2014
0200 PROCEDURE PROTOCOL: TOURNIQUET PROTOCOL

Indications

A. A tourniquet may be used to control potentially fatal hemorrhage only after other means of hemorrhage control have failed.

Precautions

A. A tourniquet applied incorrectly can increase blood loss.
B. Applying a tourniquet can cause nerve and tissue damage whether applied correctly or not. Proper patient selection is of utmost importance.
C. Injury due to tourniquet is unlikely if the tourniquet is removed within 1 hour. In cases of life-threatening bleeding benefit outweighs theoretical risk.
D. A commercially made tourniquet is the preferred tourniquet. If none is available, a blood pressure cuff inflated to a pressure sufficient to stop bleeding is an acceptable alternative. Other improvised tourniquets are not allowed.

Technique

A. First attempt to control hemorrhage by using direct pressure over bleeding area.
B. If a discrete bleeding vessel can be identified, point pressure over bleeding vessel is more effective than a large bandage and diffuse pressure.
C. If unable to control hemorrhage using direct pressure, apply tourniquet according to manufacturer specifications and using the steps below:
   1. Cut away any clothing so that the tourniquet will be clearly visible. NEVER obscure a tourniquet with clothing or bandages.
   2. Apply tourniquet proximal to the wound and not across any joints.
   3. Tighten tourniquet until bleeding stops. Applying tourniquet too loosely will only increase blood loss by inhibiting venous return.
   4. Mark the time and date of application on the patient’s skin next to the tourniquet.
   5. Keep tourniquet on throughout hospital transport – a correctly applied tourniquet should only be removed by the receiving hospital.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0210 PROCEDURE PROTOCOL: NEEDLE THORACOSTOMY FOR TENSION PNEUMOTHORAX DECOMPRESSION

Indication:

A. Needle decompression of tension pneumothorax is a standing order for EMT-I and Paramedics.
B. **All** of the following clinical indicators must be present:
   1. Severe respiratory distress
   2. Hypotension
   3. Unilateral absent or decreased breath sounds

Technique:

A. Expose entire chest
B. Clean skin overlying site with available skin prep
C. Insert largest, longest available angiocath either at 2\(^{nd}\) intercostal space at midclavicular line, or 5\(^{th}\) intercostal space at midaxillary line
   1. Either approach is acceptable, generally the site with the least soft tissue overlying ribs is preferred
D. Notify receiving hospital of needle decompression attempt

Precautions:

A. Angiocath may become occluded with blood or by soft tissue
B. A simple pneumothorax is NOT an indication for needle decompression

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0220 PROCEDURE PROTOCOL: INTRAOSSEUS CATHETER PLACEMENT

Indications (must meet all criteria):

A. Rescue or primary vascular access device when peripheral IV access not obtainable in a patient with critical illness defined as:
   1. Cardiopulmonary arrest or impending arrest
   2. Profound shock with severe hypotension and poor perfusion
B. Utilization of IO access for all other patients requires Base Contact
   1. E.g.: Hypoglycemia with severe symptoms (e.g. unresponsive) and no venous access
C. IO placement may be considered prior to peripheral IV attempts in critical patients without identifiable peripheral veins

Technique:

A. Site of choice – tibial plateau: 2 fingerbreadths below the tibial tuberosity on the anteromedial surface of tibia.
   1. Alternative sites (e.g. humeral head in adults) are device-specific and require authorization from the agency Medical Director.
B. Clean skin with povidone-iodine.
C. Place intraosseous needle perpendicular to the bone.
D. Follow manufacturer’s guidelines specific to the device being used for insertion.
E. Entrance into the bone marrow is indicated by a sudden loss of resistance.
F. Flush line with 10 mL saline. Do not attempt to aspirate marrow
   a. If patient conscious, administer lidocaine for pain control before infusing any other fluids
G. Secure line
   1. Even if properly placed, the needle will not be secure. The needle must be secured and the IV tubing taped. The IO needle should be stabilized at all times.
H. Observe for signs of limb swelling, decreased perfusion to distal extremity that would indicate a malpositioned IO catheter or other complication. If limb becomes tense or malperfused, disconnect IO tubing immediately and leave IO in place.
I. A person should be assigned to monitor the IO at the scene and en route to the hospital.
J. Do not make more than one IO placement attempt per bone.
K. Do not remove IO needles in the field.
L. Notify hospital staff of all insertion sites/attempts and apply patient wristband included with kit to identify IO patient.

Complications:

A. Fracture
B. Compartment syndrome
C. Infection

Contraindications:

A. Fracture of target bone
B. Cellulitis (skin infection overlying insertion site)
C. Osteogenesis imperfecta (rare condition predisposing to fractures with minimal trauma)
D. Total knee replacement (hardware will prevent placement)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
0220 PROCEDURE PROTOCOL: INTRAOSSEUS CATHETER PLACEMENT

Side Effects and Special Notes:
A. Some authorities recommend aspiration of marrow fluid or tissue to confirm needle location. This is not recommended for field procedures, as it increases the risk of plugging the needle.
B. Expect flow rates to be slower than peripheral IVs. Pressure bags may be needed. Any drug or IV fluid may be infused.
C. Some manufacturers recommend the use of lidocaine for the treatment of pain associated with fluid administration. Check with your manufacturer and Medical Director for further guidance
Active nosebleed

ABCs

- Tilt head forward
- Have patient blow nose to expel clots

- Spray both nares with phenylephrine
- Compress nostrils with clamp or fingers, pinching over fleshy part of nose, not bony nasal bridge
- Transport in position of comfort, usually sitting upright

IV access and IV fluid bolus if signs of hypoperfusion, shock

**General Guidelines:**
- Most nosebleeding is from an anterior source and may be easily controlled
- Avoid phenylephrine in pts with known CAD
- Anticoagulantion with aspirin, clopidogrel (Plavix), warfarin (Coumadin) will make epistaxis much harder to control. Note if your patient is taking these or other anticoagulant medications
- Posterior epistaxis is a true emergency and may require advanced ED techniques such as balloon tamponade or interventional radiology. Do not delay transport. Be prepared for potential airway issues.
- Patients using nasal cannula oxygen may have cannula placed in mouth while nares are clamped or compressed for nosebleed
0240 PROCEDURE PROTOCOL: TASER PROBE REMOVAL

Indications

- Patient with TASER probe(s) embedded in skin.

Contraindications

- TASER probe embedded in the eye or genitals. In such cases, transport patient to an emergency department for removal.

Technique

1. Confirm the TASER has been shut off and the barb cartridge has been disconnected.
2. Using a pair of shears cut the TASER wires at the base of the probe.
3. Place one hand on the patient in area where the probe is embedded and stabilize the skin surrounding the puncture site. Using the other hand (or use pliers) firmly grasp the probe.
4. In one uninterrupted motion, pull the probe out of the puncture site maintaining a 90° angle to the skin. Avoid twisting or bending the probe.
5. Repeat the process for any additional probes.
6. Once the probes are removed, inspect and assure they have been removed intact. In the event the probe is not removed intact or there is suspicion of a retained probe, the patient must be transported to the emergency department for evaluation.
7. Cleanse the probe site and surrounding skin with betadine and apply sterile dressing.
8. Advise patient to watch for signs of infection including increased pain at the site, redness swelling or fever.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
1010 OBSTRUCTED AIRWAY

Does patient show universal sign of choking?

- Perform Heimlich maneuver
- For visibly pregnant or obese patients perform chest thrusts only
- For infants, 5 chest thrusts, then 5 back slaps

Assess severity of obstruction

If obstruction is complete, patient will be mute.
If patient can speak, obstruction is incomplete

Severe or Complete Obstruction (mute, silent cough, severe stridor)

- Open airway w. head tilt-chin lift or jaw thrust if craniofacial trauma
- Attempt ventilation with BVM

Once obstruction relieved:
- Position of comfort or left lateral recumbent position
- O2 via NRB 15 Lpm
- Monitor ABCs, SpO2, vital signs
- Suction PRN and be prepared for vomiting, which commonly occurs after obstruction relieved

If still obstructed and unable to ventilate:
- Consider cricothyrotomy in adult patient if suspected supraglottic obstruction and unable to ventilate with BVM.
- Alternative: oral intubation & attempt to push object into mainstem bronchus with ETT

If obstruction cleared:
- Position of comfort or left lateral recumbent position
- O2 via NRB 15 Lpm
- Monitor ABCs, SpO2, vital signs
- Suction PRN and be prepared for vomiting, which commonly occurs after obstruction relieved

Perform abdominal thrusts until obstruction relieved then reattempt ventilations w. BVM
- For visibly pregnant or obese patients perform chest thrusts instead
- Consider chest thrusts in any patient if abdominal thrust ineffective
- For infants < 1 yr old, 5 chest thrusts, then 5 back blows

Percutaneous cricothyrotomy is a difficult and hazardous procedure that is to be used only in extraordinary circumstances. The reason for performing this procedure must be documented and submitted for review to the EMS Medical Director within 24 hours.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2000 ADULT (AGE ≥ 12 years) CARDIAC ARREST
GENERAL PRINCIPLES

Specific Information Needed For Patient Care Report
- Onset (witnessed or unwitnessed), preceding symptoms, bystander CPR, downtime before CPR and duration of CPR
- Past History: medications, medical history, suspicion of ingestion, trauma, environmental factors (hypothermia, inhalation, asphyxiation)

Document Specific Objective Findings
- Unconscious, unresponsive
- Agonal, or absent respirations
- Absent pulses
- Any signs of trauma, blood loss
- Skin temperature

General Guidelines: Chest Compressions
- 1 cycle of CPR = 30:2 chest compressions: breaths
- 5 cycles CPR = 2 minutes chest compressions
- Push hard and push fast (at least 100/minute)
- Ensure full chest recoil
- Rotate compressors every 2 minutes with rhythm checks
- During CPR, any interruption in chest compressions deprives heart and brain of necessary blood flow and lessens chance of successful defibrillation
  - Continue CPR while defibrillator is charging, and resume CPR immediately after all shocks. Do not check pulses except at end of CPR cycle and if rhythm is organized at rhythm check

General Guidelines: Defibrillation
- In unwitnessed cardiac arrest, give first 2 minutes of CPR without interruptions for ventilation. During this time period passive oxygenation is preferred with OPA and NRB facemask. If arrest is witnessed by EMS, immediate defibrillation is first priority
- All shocks should be given as single maximum energy shocks
  - Manual biphasic: follow device-specific recommendations for defibrillation. If uncertain, give maximum energy (e.g. 200J)
  - Manual monophasic: 360J
  - AED: device specific

General Guidelines: Ventilation during CPR
- If suspected cardiac etiology of arrest, during first approximately 4 minutes of VT/VF arrest, passive oxygenation with OPA and NRB facemask is preferred to positive pressure ventilation with BVM or advanced airway
- EMS personnel must use good judgment in assessing likely cause of pulseless arrest. In patients suspected of having a primary respiratory cause of cardiopulmonary arrest, (e.g.: COPD or status asthmaticus), adequate ventilation and oxygenation are a priority
- In general, patients with cardiac arrest initially have adequately oxygenated blood, but are in circulatory arrest. Therefore, chest compressions are initially more important than ventilation to provide perfusion to coronary arteries
- Do not interrupt chest compressions and do not hyperventilate. Hyperventilation decreases effectiveness of CPR and worsens outcome

General Guidelines: Timing of Placement Of Advanced Airway
- Advanced airway (e.g. King, LMA, ETT) may be placed at any time after initial 2 rounds of chest compressions and rhythm analysis, provided placement does not interrupt chest compressions
- Once an advanced airway is in place, compressions are given continuously and breaths given asynchronously at 8-10 per minute
- Always confirm advanced airway placement with ETCO2
  - Use continuous waveform capnography if available. In low flow states such as cardiac arrest, colorimetric CO2 detector may be inaccurate and not sense very low CO2 level

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2000 ADULT (AGE ≥ 12 years) CARDIAC ARREST
GENERAL PRINCIPLES

General Guidelines: Pacing

- Pacing is not indicated for asystole and PEA. Instead start chest compressions according to Universal Pulseless Arrest Algorithm.
- Pacing should not be undertaken if it follows unsuccessful defibrillation of VT/VF as it will only interfere with CPR and is not effective

General Guidelines: ICD/Pacemaker patients

- If cardiac arrest patient has an implantable cardioverter defibrillator (ICD) or pacemaker: place pacer/defib pads at least 1 inch from device. Biaxillary or anterior posterior pad placement may be used

General Notes

- CPR in a moving ambulance or pram is ineffective
- In general, work cardiac arrest on scene either to return of spontaneous circulation (ROSC) or to field pronouncement, unless scene is unsafe
- Contact Base for termination of resuscitation
2020 ADULT (AGE ≥ 12 YEARS) UNIVERSAL PULSELESS ARREST ALGORITHM

BLS Sequence
- Adult Pulseless Arrest
- Start CPR
- Get AED
- Check rhythm & shock if indicated. Repeat every 2 min

ALS Sequence
- EMT
- AEMT
- EMT-I
  - Paramedic
  - Shockable Rhythm?
    - Yes
      - VT/VF
      - Shock + CPR 2 min
      - Epinephrine
      - Shockable Rhythm?
        - Yes
          - Shock + CPR 2 min
          - Epinephrine every 3-5 min
          - Shockable Rhythm?
            - Yes
              - Shock + CPR 2 min
              - Epinephrine every 3-5 min
              - Amiodarone
              - Treat reversible causes
              - ROSC
            - No
              - Go to Box A
        - No
          - If asystole, go to box B
          - If organized rhythm, check pulse. If no pulse, go to box B
          - If ROSC, begin post-cardiac arrest care
          - Suspected hyperkalemic arrest (renal failure/dialysis patient):
            - Give calcium gluconate
            - Give sodium bicarb
            - Flush IV line between meds
          - Reversible Causes:
            - Hypovolemia
            - Hypoxia
            - Hydrogen ion (acidosis)
            - Hypo/hyperkalemia
            - Hypothermia
            - Tension pneumothorax
            - Tamponade, cardiac
            - Toxins
            - Thrombosis (pulmonary, coronary)

Compressions
- 2 minutes uninterrupted compressions before rhythm analysis unless arrest witnessed by EMS
- Minimize interruptions, resume compressions immediately after shocks, rhythm checks. Check pulses only if organized rhythm
- Push hard and fast and allow complete chest recoil
- Assess quality of CPR with continuous waveform capnography
- If ETCO₂ < 10, improved quality of compressions
- If using automated CPR devices, use manufacturer’s specifications

Ventilations
- Passive oxygenation with NRB facemask preferred for first 4 minutes (2 cycles) of CPR, unless hypoxic arrest suspected (e.g.: asphyxiation, overdose, status asthmaticus). In which case begin ventilations immediately.
- Do not overventilate
- If no advanced airway, 30:2 compression:ventilation ratio
- If advanced airway in place ventilate at rate of 8-10 breaths/min

Airway
- An advanced airway (King, LMA, ETT) may be placed at any time after initial 4 minutes of passive oxygenation, if applicable, or as soon as possible if asphyxial arrest suspected, provided placement does not interrupt compressions

ROSC
- Pulse and blood pressure
- Sustained abrupt rise in ETCO₂, typically > 40

Defibrillation
- EMT + AEMT use AED
- Intermediate and Paramedic use manual defibrillator

2025 ADULT POST-RESUSCITATION CARE FOLLOWING PULSELESS ARREST WITH RETURN OF SPONTANEOUS CIRCULATION ALGORITHM

ROSC after cardiac arrest

Initiate Post-Cardiac Arrest Care and perform 12 lead EKG
- Following ROSC several simultaneous and stepwise interventions must be performed to optimize care and maximize patient outcome.
- Algorithm stresses high priority assessments and interventions and will assist provider through complex management decisions.

Is STEMI present?

Continue/Optimize/Maintain Post-Cardiac Arrest Care and Assess for Shock State and Volume Status
- Peripheral access: IO/2LBIV
- Oxygenation/Ventilation
  - Secure advanced airway if indicated
  - Avoid hyperventilation
  - Apply and monitor ETCO2
  - Correct hypoxemia
- Place head of bed at 30 degrees

SBP < 90 AND/OR signs of poor perfusion?

If not hypovolemic, administer 1000ml NS bolus

If persistent hypotension (SBP < 90) refractory to 1000ml NS bolus, consider Vasopressor Infusion

Purposeful Response?

No

Transfer to closest appropriate facility

Yes

Continue/Optimize/Maintain Post-Cardiac Arrest Care and Assess for Dysrhythmia
- Continuous rhythm monitoring/pulse checks

Recurrent dysrhythmia?

Yes

Treat recurrent dysrhythmia per DM EMS protocol

No

Initiate TIH

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2030 ADULT (≥ 12 YEARS) TACHYARRHYTHMIA WITH POOR PERFUSION

Tachyarrhythmia with Poor Perfusion
- Support ABCs
- IV access
- Give oxygen

EMT  AEMT
EMT-I  Paramedic

Stable
- 12 lead ECG
- Identify Rhythm
- Measure QRS width

A Is patient stable?
Unstable signs include altered mental status, chest pain, hypotension, signs of shock-rate-related symptoms uncommon if HR <150

B Unstable
Immediate synchronized cardioversion

Narrow QRS
(< 0.12 msec)
Is rhythm regular?

Wide QRS
(> 0.12 msec)
Is rhythm regular?

Regular
- Try Valsalva maneuver
- Give adenosine IV if suspected AV nodal reentrant tachycardia (AVRNT)*
- EMT-I requires direct order for adenosine

Does rhythm convert?

Converts
- Monitor in transport
- If recurrent dysrhythmia, go to box A

Irregular
- Atrial fibrillation, flutter, or MAT
- Do not give adenosine
- If becomes unstable go to box B

C Irregular
- V Tach (>80%) or SVT with aberrancy
- Contact Base for verbal order for amiodarone unless contraindicated
- If regular and polymorphic (Torsades de Pointes) consider magnesium

Irregular
- See box C
- Contact Base for consult
- Do NOT give adenosine

Doesn’t Convert
- Contact base for consult
- Monitor in transport
- If unstable, go to box B

*AVRNT is historically referred to as “PSVT”

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2040 ADULT (AGE ≥ 12 YEARS) BRADYARRHYTHMIA WITH POOR PERFUSION

Bradycardia with a pulse
Heart rate < 60 and inadequate for clinical condition

- Support ABCs
- Give Oxygen
- Start IV
- Initiate transport

- Cardiac monitor
- Identify rhythm
- 12-lead ECG

Are there signs or symptoms of poor perfusion present?
(Altered mental status, chest pain, hypotension, signs of shock)

Adequate perfusion
- Monitor and transport

Poor perfusion
- Give atropine
- Prepare for transcutaneous pacing

- Consider vasopressor infusion early if pacing and poor perfusion or hypotension persists either due to lack of capture or poor contractility despite capture

Monitor and transport

Reminders:
- If pulseless arrest develops, go to pulseless arrest algorithm
- Search for possible contributing factors: “5 Hs and 5 Ts”
- Symptomatic severe bradycardia is usually related to one of the following:
  - Ischemia (MI)
  - Drugs (beta blocker, Calcium channel blocker)
  - Electrolytes (hyperkalemia)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2050 ADULT CHEST PAIN

Consider life threatening causes of chest pain in all patients

- While assessing ABCs give supplemental oxygen, monitor vital signs, cardiac rhythm, start IV
- Obtain 12-lead ECG
- Administer aspirin if history suggests possible cardiac chest pain

STEMI?

No Yes

Notify receiving facility immediately if Cardiac Alert criteria met

Give SL nitroglycerin if suspected cardiac chest pain and no contraindication

An EMT may administer patient's prescribed nitroglycerin, Contact Base for verbal order

For hypotension following nitroglycerin give 250 mL NS bolus, reassess, and repeat bolus as needed. Do not give additional nitroglycerin.

Consider opioid for chest pain refractory to nitroglycerin, if no contraindication

- Consider repeat 12-lead if initial 12-lead non-diagnostic and/or patient's condition changes
- Consider additional 12-lead views such as R sided leads for R ventricular infarct if inferior MI present

Life threatening causes of chest pain

- Acute coronary syndrome (ACS)
- Pulmonary embolism
- Thoracic aortic dissection
- Tension pneumothorax

Nitroglycerin Contraindications

- Suspected right ventricular ST-segment elevation MI (inferior STEMI pattern plus ST elevation in right-sided precordial leads e.g. V4R)
- Hypotension SBP < 100
- Recent use of erectile dysfunction (ED) medication (e.g. Viagra, Cialis)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2051 CARDIAC ALERT

Goal:

• To identify patients with ST-segment elevation myocardial infarction (STEMI) in the prehospital setting and provide advanced receiving hospital notification in order to minimize door-to-balloon times for percutaneous coronary intervention (PCI)

Inclusion Criteria:

• Symptoms compatible with ACS (chest pain, diaphoresis, dyspnea, etc)
• 12-lead ECG showing ST-segment elevation (STE) at least 1 mm in two or more anatomically contiguous leads
• Age 35-85 years old (If STEMI patient outside age criteria, contact receiving hospital for consult)

Exclusion Criteria:

• Wide complex QRS (paced rhythm, BBB, other)
• Symptoms NOT suggestive of ACS (e.g.: asymptomatic patient)
• If unsure if patient is appropriate for Cardiac Alert, discuss with receiving hospital MD

Actions:

• Treat according to chest pain protocol en route (cardiac monitor, oxygen, aspirin, nitroglycerine and opioid)
• Notify receiving hospital ASAP with ETA and request CARDIAC ALERT. Do not delay hospital notification. If possible, notify ED before leaving scene
• Start 2 large bore peripheral IVs
• Rapid transport
• If patient does not meet inclusion criteria, or has exclusion criteria, yet clinical scenario and ECG suggests true STEMI, request medical consult with receiving hospital emergency physician

Additional Documentation Requirements:

• Time of first patient contact
• Time of first ECG

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
2100 HYPERTENSION

Intent:

A. Even with extremes of blood pressure, treat the medical emergency associated with hypertension ("treat the patient, not the number")
   1. Treat chest pain, pulmonary edema, or stroke according to standard protocols (pain control will usually improve BP significantly)
B. Do not use medication to treat asymptomatic hypertension
C. Do not treat hypertension in acute stroke

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Consider pulmonary and non-pulmonary causes of respiratory distress:

- Pulmonary embolism
- Pneumonia
- Heart attack
- Pneumothorax
- Sepsis
- Metabolic acidosis (e.g.: DKA)
- Anxiety

Mixed picture may exist

- Goal is maximization of oxygenation and ventilation in all cases
- CPAP may be particularly useful in mixed picture with hypoxia and/or hypoventilation
- Avoid furosemide in uncertain diagnosis
- Avoid albuterol in suspected pulmonary edema

• Transport
• Provide supportive care
• Maximize oxygenation and ventilation
• Contact base if needed for consult

*Consider 12 lead ECG*
3020 ADULT (AGE ≥ 12 YEARS) ASTHMA

Universal Respiratory Distress Protocol and prepare for immediate transport

Presentation suggests asthma: wheezing, prolonged expiratory phase, decreased breath sounds, accessory muscle use, known hx of asthma

Give nebulized albuterol + ipratropium
May give continuous neb for severe respiratory distress

Therapeutic Goals:
- Maximize oxygenation
- Decrease work of breathing
- Identify cardiac ischemia (Obtain 12 lead EKG)
- Identify complications, e.g. pneumothorax

Give oxygen, check SpO₂, & consider IV for severe respiratory distress

EMT may administer either MDI or nebulized albuterol with base contact for verbal order

Is response to treatment adequate?

Yes

Severe exacerbation:
- IV methylprednisolone
  Consider IM epinephrine. Indicated only if no response to neb and severe distress
  - IV magnesium w. base contact

No

Yes

Severe exacerbation:
- IV methylprednisolone
- Consider IM epinephrine. Indicated only if no response to neb and severe distress
  - IV magnesium w. base contact (if not already given)
  - Obtain ECG: rule out unstable rhythm, ACS

No

- Reassess for pneumothorax
- Consider CPAP
- If CPAP contraindicated, ventilate with BVM, and consider advanced airway
- Consider IM epinephrine
  - IV magnesium w. base contact (if not already given)
  - Obtain ECG: rule out unstable rhythm, ACS

- Continue monitoring and assessment en route
- Be prepared to assist ventilations as needed
- Contact base for medical consult as needed

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Presentation suggests COPD: Hx of COPD w. wheezing, prolonged expiratory phase, decreased breath sounds, accessory muscle use

Give nebulized albuterol + ipratropium

May give continuous albuterol neb for severe respiratory distress

Is response to treatment adequate?

No

- Reassess for pneumothorax
- Consider alternative diagnoses, including cardiac disease
- Consider CPAP if severe distress

Yes

- Give IV methylprednisolone
- Assist ventilations with BVM as needed
- Consider advanced airway if CPAP contraindicated or not available

Obtain ECG: rule out unstable rhythm, ACS

- Continue continuous cardiac monitoring, SpO2 and capnography, if available
- Be prepared to assist ventilations as needed
- Contact base for medical consult as needed

Therapeutic Goals:
- Maximize oxygenation
- Decrease work of breathing
- Identify cardiac ischemia (Obtain 12 lead EKG)
- Identify complications, e.g. pneumothorax

Special Notes:
- Correct hypoxia: do not withhold maximum oxygen for fear of CO2 retention
- Consider pulmonary and non-pulmonary causes of respiratory distress: Examples: pulmonary embolism, pneumonia, pulmonary edema, anaphylaxis, heart attack, pneumothorax, sepsis, metabolic acidosis (e.g.: DKA), Anxiety
- Patients with COPD are older and have comorbidities, including heart disease.
- Wheezing may be a presentation of pulmonary edema, “cardiac asthma”
- Common triggers for COPD exacerbations include: Infection, dysrhythmia (e.g.: atrial fibrillation), myocardial ischemia

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Universal Respiratory Distress Protocol

CHF/Pulmonary edema

Give nitroglycerin (NTG)

Is oxygenation and ventilation adequate?

Start CPAP protocol

Obtain 12 lead ECG: rule out unstable rhythm, STEMI

Therapeutic Goals:
• Maximize oxygenation
• Decrease work of breathing
• Identify cardiac ischemia (Obtain 12 lead ECG)

Special Notes:
• In general diuretics have little role in initial treatment of acute pulmonary edema and are no longer considered first line therapy.
• Morphine has been associated with worse outcomes in patients with CHF and is no longer preferred

Is response to treatment adequate?

If failing above therapy:
• Remove CPAP and ventilate with BVM
• Consider pneumothorax
• Consider alternative diagnoses/complications
• Consider advanced airway

• Continue monitoring and assessment
• Transport
• Contact Base for medical consult as needed

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
POSSIBLE STROKE
Any acute onset neurological deficit not likely due to trauma

Assess and stabilize ABCs, give O₂

Assess Cincinnati Prehospital Stroke Score (Presence of single sign sufficient)

Rule out or treat hypoglycemia

• Determine when last KNOWN to be normal and document specific time
• “At 2:15 PM”, not “1 hour ago”

Consider common stroke mimics/syndromes

• Obtain medical history
• Document medications
• Identify family or friend who may assist with history and decision-making, get contact info and strongly encourage to come to ED as they may be needed for consent for treatments

Start IV and draw blood
• Document cardiac rhythm
• Ensure full monitoring in place: cardiac, SpO₂

Fully monitor patient and continually reassess:
• Improvement or worsening of deficit
• Adequacy of ventilation and oxygenation
• Cardiovascular stability

• Notify receiving hospital of suspected stroke and time of onset of symptoms in order to provide hospital the opportunity for Stroke Alert
• It is more important that you know timeline of your patient’s symptoms than an individual hospital’s Stroke Alert criteria, which may vary

Cincinnati Prehospital Stroke Score
Think “FAST” (face, arm, speech, time)

Assess Facial Droop
Say: “Smile for me”, or “Show me your teeth”

Assess Arm Pronator Drift
Demonstrate, and say: “Put your arms up for me like this and hold them while I count to 10”

Assess Speech
Say: “Repeat after me: you can’t teach an old dog new tricks”, or “No ifs, ands, or buts”

CPSS does not identify all strokes. See below

Stroke Mimics
• Hypoglycemia
• Post-ictal paralysis
• Complex migraine
• Overdose
• Trauma
• Bell’s palsy

• The Cincinnati Prehospital Stroke Score (CPSS) is designed to be very reproducible and identify those strokes most likely to benefit from reperfusion therapy, but does not identify all strokes.
• The CPSS is highly specific for stroke, but is not extremely sensitive, meaning if you have a positive CPSS, you are almost certainly having a stroke, but if you do not have a positive CPSS, you still may be having a stroke
• Stroke signs may be very subtle, therefore it is important to know other signs of stroke, which include:
  • Impaired balance or coordination
  • Vision loss
  • Headache
  • Confusion or altered mental status
  • Seizure

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Altered Mental Status (ΔMS)

Assess ABCs
Go to pulseless arrest, respiratory distress or obstructed airway algorithms as appropriate

Persistent ΔMS?
Yes
Check BGL and consider trial of Naloxone

No

• Determine character of event
• Consider seizure, syncope and TIA
• Monitor and transport with supportive care

BGL < 60 mg/dL or clinical condition suggests hypoglycemia?
Yes
Hypoglycemia protocol

No

Seizure activity present?
Yes
Seizure protocol

No

Focal neuro deficit or positive CPSS?
Yes
Stroke protocol

No

Consider other causes of ΔMS:
Head trauma, overdose, hypoxia, hypercapnea, heat/cold emergency, sepsis, & metabolic

• During transport: give supplemental oxygen, monitor vital signs, airway, breathing, and cardiac rhythm.
• Give fluid bolus if volume depletion or sepsis suspected

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4013 ADULT (≥ 12 YEARS) SEIZURE

- Support ABCs:
  - Give oxygen
  - Rule out or treat hypoglycemia
  - Universal seizure precautions (see below)
  - Consider the cause (see below)

**Actively Seizing?**

**Yes**

- If seizure brief and self-limited, treatment not necessary
- If prolonged (e.g.: > 5 min) or recurrent sz, then treat as follows:
  - Give benzodiazepine

**Actively seizing after 5 minutes?**

**Yes**

- Establish IV access if not already in place
- Repeat benzodiazepine

**Actively seizing after 5 minutes?**

**No**

- Check pulse and reassess ABC
- Give supplemental oxygen

- Transport and monitor ABCs, vital signs, and neurological condition
- Cardiac monitoring if recurrent seizures and/or meds given
- Complete head to toe assessment

**Universal Seizure Precautions:**

- Ensure airway patency, but do not force anything between teeth. NPA may be useful
- Give oxygen
- Suction as needed
- Protect patient from injury
- Check pulse immediately after seizure stops
- Keep patient on side

**Document:**

- Document: Seizure history: onset, time interval, previous seizures, type of seizure
- Obtain medical history: head trauma, diabetes, substance abuse, medications, compliance with anticonvulsants, pregnancy

**Pregnancy and Seizure:**

- If 3rd trimester pregnancy or post-partum: administer magnesium sulfate

**Consider the Cause of Seizure**

- Epilepsy
- EtOH withdrawal or intoxication
- Hypoglycemia
- Stimulant use
- Trauma
- Intracranial hemorrhage
- Overdose (TCA)
- Eclampsia
- Infection: Meningitis, sepsis

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Check blood glucose level in ANY patient with signs or symptoms consistent with hypoglycemia

Examples: Altered MS, agitation, focal neurologic deficit, seizure, weakness, diaphoresis, decreased motor tone, pallor

If hypoglycemia still most likely despite normal reading on glucometer, administer glucose regardless, while considering other causes of altered mental status

Is BGL < 60?

Yes

Can the patient safely tolerate oral glucose?

intact gag reflex, follows verbal commands

Yes

Administer oral glucose. Reassess patient

No

Are you able to establish IV access?

Yes

Administer dextrose IV & reassess patient

No

Symptoms resolved?

Yes

Monitor and transport or contact base for refusal if indicated

No

Regarding refusals after a hypoglycemic episode:

See Patient Refusal protocol

Transport is always indicated for any of the following patients:

• Pts with unexplained hypoglycemia
• Pts taking oral hypoglycemic meds
• Pts not taking food by mouth
• Pts who do not have competent adult to monitor

Still symptomatic?

Yes

No

Recheck BGL and consider other causes of altered mental status

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4015 ALCOHOL INTOXICATION

Clinical alcohol intoxication

Determine LOC and assess ABCs
- Obtain vital signs
- Perform head-to-toe exam
- Determine medical history, medications
- Check BGL unless mild symptoms and if considering release

BGL < 60 mg/dL or clinical condition suggests hypoglycemia?

Yes
- Hypoglycemia protocol

No

Does patient have evidence of incapacitating intoxication?

Yes
- Transport to ED

No

DEFINITIONS:

Intoxicated patient with any of the following must be transported to ED:

Incapacitating Intoxication
- Inability to maintain airway
- Inability to stand from seated position and walk with minimal assistance
- At immediate risk of environmental exposure or trauma due to unsafe location

Acute Illness or Injury
- Abnormal vital signs
- Physical complaints that might indicate an underlying medical emergency, e.g.: chest pain
- Seizure or hypoglycemia
- Signs of trauma or history of acute trauma
- Signs of head injury, e.g.: bruising, lacerations, abrasions

Does patient have signs of acute illness or injury?

Yes
- Transport to ED

No

Contact base if considering release to other party, e.g.: police, family

(IMPORTANT: individual agency policy may apply)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Allergic reaction, anaphylaxis or angioedema

- Assess ABCs, give oxygen
- If possible, determine likely trigger
- Determine PMH, medications, allergies
- Classify based on symptom severity and systems involved
- Other specific protocols may apply: e.g.: obstructed airway, bites & envenomations

---

**Generalized or Systemic Reaction**
*Multisystem involvement: skin, lungs, airway, etc*

- Does patient have any of the following signs or symptoms?
  - Hypotension
  - Signs of poor perfusion
  - Bronchospasm, stridor
  - Altered mental status

  **Yes**
  - Transport and reassess for signs of deterioration

  **No**
  - Consider diphenhydramine if significant discomfort

- Give epinephrine IM, then:
  - Start IV and give IV fluid bolus 20cc/kg NS
  - Give diphenhydramine
  - Give methylprednisolone
  - Consider addition of albuterol if wheezing

- Monitor ABCs, SpO2, cardiac rhythm
- Reassess for signs of deterioration

- If persistent signs of severe shock with hypotension not responsive to IM epinephrine and fluid bolus:
  - Contact Base
  - Consider IV epinephrine drip per vasopressor infusion protocol

- Consider diphenhydramine if significant discomfort

---

**Localized Reaction**
*Including isolated tongue, airway*

- Airway Involvement?
  - Tongue or uvula swelling, stridor

  **Yes**
  - Impending airway obstruction?

    **Yes**
    - EMT may use EpiPen auto injector if available whenever epinephrine IM indicated.
    - Transport and reassess for signs of deterioration
    - Give immediate IM epinephrine & manage airway per Obstructed Airway Protocol

    **No**
    - Start IV
    - Give diphenhydramine
    - Give methylprednisolone

    **No**
    - Consider addition of albuterol if wheezing

- No

---

**Definitions:**
- **Anaphylaxis:** severe allergic reaction that is rapid in onset and potentially life-threatening. Multisystem signs and symptoms are present including skin and mucus membranes
  - **Mainstay of treatment is epinephrine**
- **Angioedema:** deep mucosal edema causing swelling of mucus membranes of upper airway. May accompany hives
  - **Mainstay of treatment is methylprednisolone.**
  - Epinephrine indicated for any impending airway obstruction.

**Document:**
- History of allergen exposure, prior allergic reaction and severity, medications or treatments administered prior to EMS assessment
- Specific symptoms and signs presented: itching, wheezing, respiratory distress, nausea, weakness, rash, anxiety, swelling of face, lips, tongue, throat, chest tightness, etc.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4030 ABDOMINAL PAIN/VOMITING

Abdominal pain and/or vomiting

**Abdominal exam:**
- Gently palpate 4 quadrants, noting areas of tenderness, guarding, rigidity or distension
- Note any pulsatile mass
- Note surgical scars

**History:**
- Onset, location, duration, radiation of pain
- Associated sx: vomiting, GU sx, hematemesis, coffee ground emesis, melena, rectal bleeding, vag bleeding, known or suspected pregnancy, recent trauma

**Assess ABCs**
- Give oxygen
- Identify signs of shock and hypovolemia
- Consider cardiac etiology
- Identify GI bleeding
- Transport in position of comfort
- Head-to-toe assessment

**Start IV**
- If GI bleed, consider 2nd IV
- Vital signs, head-to-toe exam

**Cardiac monitor and 12 lead ECG if diabetic, age > 50 and upper abdominal pain or unstable vital signs**
- Antiemetic if vomiting. EMT/EMT-IV may give ODT ondansetron only and require VO

**Signs of hypotension, poor perfusion or shock?**
- Yes
  - 2 large bore IVs
  - 20 mL/kg NS bolus
  - Elevate legs
  - Reassess response to treatment
  - See Hypotension/shock protocol

- No
  - Consider opioid for severe pain

**Elderly Patients:**
- Much more likely to have life-threatening cause of symptoms
- Always consider vascular emergencies: AAA, MI
- Shock may be occult, with absent tachycardia in setting of severe hypovolemia

**Monitor and transport**
- Frequent reassessment for deterioration and response to treatment

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
PPE and decontaminate when appropriate

Obtain specific information:
- Type of ingestion(s)
- What, when and how much ingested?
- Bring the poison, container, all medication and other questionable substances to the ED
- Note actions taken by bystanders or patient (e.g.: induced emesis, “antidotes”, etc)
- Supportive Care is key to overdose management

ABCs
IV, oxygen, monitor

Need for airway management?
- Yes
  - Naloxone
  - Airway adjuncts and BVM ventilations as needed
  - See airway management protocols
- No

Hypotension?
- Yes
  - IV fluid bolus per hypotension/shock protocol
  - Consider vasopressor infusion if no response to 20cc/kg NS bolus
- No

Altered mental status?
- Yes
  - Universal Altered Mental Status Protocol
  - Check BGL
  - Consider specific ingestions
- No

Specific ingestion?

Stimulant
- Tachycardia, HTN, agitation, sweating, psychosis
- Benzodiazepine for severe symptoms
- See Agitated/Combative Patient protocol

Tricyclic antidepressant
- Wide complex tachycardia, seizure
- Sodium bicarbonate for QRS > 100 msec
  - If intubated, consider hyperventilation to ETCO2 25-30
  - See Seizure protocol

Organophosphate or nerve agent
- DUMBELS syndrome
- Nerve Agent Antidote Kit
  - Atropine
  - Pralidoxime

Calcium Channel Blocker
- Bradycardia, heart block, hypotension
- Calcium and vasopressor infusion for hypotension
- 20 mL/kg NS bolus
- Glucagon (AEMT, EMT-I requires verbal order)

β-Blocker
- Bradycardia, heart block, hypotension
- 20 mL/kg NS bolus
- Vasopressor Infusion
- Glucagon (AEMT, EMT-I requires verbal order)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4050 SUSPECTED CARBON MONOXIDE EXPOSURE

ABCs

Symptoms of CO or Hypoxia

YES

100% Oxygen Transport

NO

Measure COHb % (SpCO)

SPCO 0% to 5%

No further evaluation of SPCO is needed

SPCO > 5%

SPCO < 15%

Contact base for further instruction

SPCO > 15%

100% Oxygen Transport

General Guidelines:

- **Signs and Symptoms of CO exposure include:**
  - Headache, dizziness, coma, altered mentation, seizures, visual changes, chest pain, tachycardia, arrhythmias, dyspnea, N/V, “flu-like illness”
  - The absence or low readings of COHb is not a reliable predictor of toxicity of other fire byproducts
  - In smoke inhalation victims, consider cyanide treatment with Hydroxycobalamin as per indications
  - The fetus of a pregnant woman is at higher risk due to the greater affinity of fetal hemoglobin to CO. With CO exposure, the pregnant woman may be asymptomatic while the fetus may be in distress

<table>
<thead>

**4051 HIGH ALTITUDE ILLNESS**

**Acute mountain sickness (AMS):** headache, insomnia, anorexia, nausea, fatigue

**High-altitude pulmonary edema (HAPE):** dyspnea, cough, headache, nausea, fever

**High-altitude cerebral edema (HACE):** ataxia, confusion, neuro deficits, seizure, coma, and headache

**Symptoms of illness at altitude**

- ABCs
- IV, oxygen
- Cardiac monitor
- Head to toe assessment
- Complete history:
  - Rate of ascent, prior altitude illness, rapidity of sx onset
  - Consider non-altitude-related illness
- Never assume that symptoms at altitude are necessary due to altitude illness.
- Acute exacerbations of chronic medical illness at altitude are more common than altitude illness.

**AMS**
- 20cc/kg NS bolus
- Antiemetic if vomiting. EMT/EMT-IV may give ODT ondansetron only and require VO

**HAPE**
- O₂ NRB facemask
- Assist ventilations as needed
- Consider CPAP
- Do NOT give diuretic
- Airway management as indicated

**HACE**
- Descent from altitude
- O₂ NRB facemask
- Assist ventilations as needed
- Elevate head of bed
- Assess for need for airway protection

**Special Notes:**

- There are no specific factors that accurately predict susceptibility to altitude sickness, but symptoms are worsened by exertion, dehydration, and alcohol ingestion.
- Acute Mountain Sickness (AMS) can begin to appear at around 6,500 ft above sea level, although most people will tolerate up to 8000 ft without difficulty. Altitude illness should not be suspected below 6,500 ft. AMS is the most frequent type of altitude sickness encountered. Symptoms often manifest themselves six to ten hours after ascent and generally subside in one to two days, but they occasionally develop into the more serious conditions.
- High altitude pulmonary edema (HAPE) and cerebral edema (HACE) are the most severe forms of high altitude illness. The rate of ascent, altitude attained, exertion, and individual susceptibility are contributing factors to the onset and severity of high-altitude illness.
- Mild HAPE may be managed with high-flow oxygen and supportive care, and does not necessarily require descent from altitude.
- More severe forms of HAPE and all forms of HACE require descent.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4052 DROWNING

**Specific Information Needed:**
- Length of submersion
- Degree of contamination of water
- Water temperature
- Diving accident and/or suspected trauma

**EMT**
- Spinal Immobilization before moving patient if trauma suspected
- Assess mental status
- Awake and alert
  - Remove wet garments, dry and insulate patient
  - Transport, even if initial assessment normal
  - Monitor ABC, VS, mental status

**EMT-I**
- Awake but altered LOC
  - Remove wet garments, dry and insulate patient
  - Suction as needed
  - Start IV, check BGL, give oxygen
  - Transport
  - Monitor ABC, VS, mental status
  - Monitor cardiac rhythm

**AEMT**
- Comatose or unresponsive
  - Pulse Present?
    - No
      - Remove wet garments, dry and insulate patient
      - Heimlich maneuver NOT indicated
      - Consider all causes of Altered Mental Status
      - Suction as needed
      - Start IV, obtain BGL and give oxygen
      - Monitor ABC, VS, mental status, ETCO2
      - Consider advanced airway especially if suspected pulmonary edema
      - Monitor cardiac rhythm
    - Yes
      - Start CPR, attach AED/monitor/defibrillator and treat per Universal Pulseless Arrest Algorithm with following changes:
        - Asystole or V-fib/VT
          - Single dose Epinephrine IV/IO
          - For Vfib/VT: single attempt defibrillation only
        - PEA
          - Handle very gently
          - Start IV w. warm IVF
          - Insulate patient
          - Consider advanced airway especially if suspected pulmonary edema
          - Monitor cardiac rhythm

**Paramedic**
- Drowning/submersion commonly associated with hypothermia.
- Even profound bradycardias may be sufficient in setting of severe hypothermia and decreased O2 demand
- Good outcomes after even prolonged hypothermic arrest are possible
- Patients should not be pronounced dead until rewarmed in hospital
- BLS: pulse and respirations may be very slow and difficult to detect if patient is severely hypothermic. If no definite pulse, and no signs of life, begin CPR
- If not breathing, start rescue breathing
- ALS: advanced airway and resuscitation medications are indicated

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**Hypothermia and Frostbite**

**Localized cold injury**
- Frostbite, frostnip
  - Remove wet garments, dry and insulate patient
  - Transport, even if initial assessment normal
  - Monitor ABC, VS, mental status
  - Dress injured area lightly in clean cloth to protect from further injury
  - Do not rub, do not break blisters
  - Do not allow injured part to refreeze. Repeated thaw freeze cycles are especially harmful
  - Monitor for signs of systemic hypothermia

**Systemic hypothermia**
- Presumed to be primary problem based on clinical scenario
  - Monitor cardiac rhythm
  - High flow O₂
  - ABCs

**Awake but altered LOC**
- Remove wet garments, dry and insulate patient
- Suction as needed
- Start IV, BGL, oxygen
- Transport
- Monitor ABC, VS, mental status

**Comatose or unresponsive**
- Pulse Present?
  - No
  - Yes

**PEA**
- Asystole or V-fib/VT
  - Single dose Epinephrine IV/IO
  - For Vfib/VT: single attempt defibrillation only

**Consider advanced airway, especially if suspected pulmonary edema**
- Monitor cardiac rhythm

**Consider advanced airway especially if suspected pulmonary edema**
- Monitor cardiac rhythm, ETCO₂

**Even profound bradycardias may be sufficient in setting of severe hypothermia and decreased O₂ demand**
- Good outcomes after even prolonged hypothermic arrest are possible
- Patients should not be pronounced dead until rewarmed in hospital
- BLS: pulse and respirations may be very slow and difficult to detect if patient is severely hypothermic. If no definite pulse, and no signs of life, begin CPR
- If not breathing, start rescue breathing
- ALS: advanced airway and resuscitation medications are indicated

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4054 ENVIRONMENTAL HYPERTHERMIA

Hyperthermia
- Classify by clinical syndrome
- Consider non-environmental causes (see below)

Heat Cramps
- Normal or slightly elevated body temperature
- Warm, moist skin
- Generalized weakness
- Diffuse muscle cramping

Heat Exhaustion
- Elevated body temperature
- Cool, diaphoretic skin
- Generalized weakness
- Anxiety
- Headache
- Tachypnea
- Possible syncope

Heat Stroke
- Very high core body temperature
- Hot, dry skin w. cessation of sweating
- Hypotension
- Altered mental status
- Seizure
- Coma

Rapid transport indicated

Adequate airway and breathing?

No
- Assist ventilations and manage airway as needed
- Start IV, administer O₂
- IVF 20cc/kg bolus with cool saline unless signs of volume overload

Yes
- Monitor VS and transport

Consider other causes of hyperthermia besides environment exposure, including:

- Neuroleptic malignant syndrome (NMS): patients taking antipsychotic medications
- Sympathomimetic overdose: cocaine, methamphetamine
- Anticholinergic toxidrome: overdose (“Mad as a hatter, hot as a hare, blind as a bat, red as a beet”) common w. ODs on psych meds, OTC cold medications, Benadryl, Jimson weed, etc.
- Infection: fever (sepsis)
- Thyrotoxicosis: goiter (enlarged thyroid)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**4055 INSECT/ARACHNID STINGS AND BITES PROTOCOL**

**Initiate general care for bites and stings**

**Assess for localized vs. systemic signs and symptoms and depending on animal involved**

**Localized Symptoms:**
- Pain, warmth and swelling

**Systemic Symptoms:**
- Hives, generalized erythema, swelling, angioedema
- Hypotension
- Altered mental status
- Other signs of shock

**Consider opioid for severe pain (e.g.: black widow spider) and/or diphenhydramine if needed for itching**

**Administer oxygen**

**Start IV**

**Treat per allergy & anaphylaxis protocol**

**General Care**
- For bees/wasps:
  - Remove stinger mechanism by scraping with a straight edge. Do not squeeze venom sac
- For spiders:
  - Bring in spider if captured or dead for identification

**Specific Information Needed:**
- Timing of bite/sting
- Identification of spider, bee, wasp, other insect, if possible
- History of prior allergic reactions to similar exposures
- Treatment prior to EMS eval: e.g. EpiPen, diphenhydramine, etc

**Specific Precautions:**
- For all types of bites and stings, the goal of prehospital care is to prevent further envenomation and to treat allergic reactions
- BLS personnel may assist patient with administering own Epipen and oral antihistamine
- Anaphylactoid reactions may occur upon first exposure to allergen, and do not require prior sensitization
- Anaphylactic reactions typically occur abruptly, and rarely > 60 minutes after exposure

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4056 SNAKE BITE PROTOCOL

EMT  AEMT  EMT-I  Paramedic

- Assess ABCs, mental status
- Administer oxygen
- Start IV
- Monitor VS

Initiate general care for snake bites

Assess for localized vs. systemic signs and symptoms

Localized Symptoms:
- Pain and swelling
- Numbness, tingling to bitten part
- Bruising/ecchymoses

Systemic Symptoms:
- Metallic or peculiar taste in mouth
- Hypotension
- Alter ed mental status
- Widespread bleeding
- Other signs of shock

Obtain specific information:
- Appearance of snake (rattle, color, thermal pit, elliptical pupils)
- Appearance of wound: location, # of fangs vs. entire jaw imprint
- Timing of bite
- Prior 1st aid
- To help with identification of snake, photograph snake, if possible. Include image of head, tail, and any distinctive markings.
- Do not bring snake to ED

Be prepared to manage airway if signs of airway obstruction develop

Opioid for severe pain

- Transport with bitten part immobilized
- Monitor ABCs and for development of systemic signs/sx
- Complete General Care en route

Opioid for severe pain and if not contraindicated by hypotension

Treat hypotension w. 20cc/kg IV NS bolus
See hypotension/shock protocol

Specific Precautions:
- The prairie rattlesnake is native to Denver Metro region and is most common venomous snake bite in region
- Exotic venomous snakes, such as pets or zoo animals, may have different signs and symptoms than those of pit vipers. In case of exotic snake bite, contact base and consult zoo staff or poison center for direction.
- If adequate photo can be taken, it is not necessary to bring snake to ED.
- Never pick up a presumed-to-be-dead snake by hand. Rather, use a shovel or stick. A dead snake may reflexively bite and envenomate.
- > 25% of snake bites are “dry bites”, without envenomations.
- Conversely, initial appearance of bite may be deceiving as to severity of envenomation.
- Fang marks are characteristic of pit viper bites (e.g. rattlesnakes).
- Jaw prints, without fang marks, are more characteristic of non-venomous species.

General Care:
- Remove patient from proximity to snake
- Remove all constricting items from bitten limb (e.g.: rings, jewelry, watch, etc.)
- Immobilize bitten part
- Initiate prompt transport
- Do NOT use ice, refrigerants, tourniquets, scalpels or suction devices
- Mark margins of erythema and/or edema with pen or marker and include time measured

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4060 MEDICAL HYPOTENSION/SHOCK PROTOCOL

**Shock** is a state of decreased tissue oxygenation. Significant vital organ hypoperfusion may be present without hypotension. Home medications and/or comorbidities may also limit development of tachycardia

---

**Goal** is to maximize oxygen delivery with supplemental oxygen and assisted ventilations (if needed), and to maximize perfusion with IV fluids

---

**Septic Shock**

Defined by:

1. Presence of Systemic Inflammatory Response Syndrome (SIRS) AND
2. Suspected infection AND
3. Signs of hypoperfusion (hypotension or elevated venous lactate)

**SIRS criteria:**

- HR > 110
- RR > 24
- Temp > 100.4° or < 96.8° F

The initial treatment of septic shock involves maximizing perfusion with IVF boluses, not vasopressors

---

**Lactate Measurement**

At this time there is insufficient evidence to recommend for or against routine point of care measurement of lactate by EMS. Although it shows promise for improved detection of hypoperfusion, lactate measurement is not considered mandatory or standard of care by the Denver Metro EMS Medical Directors. Its use will be governed by individual agency Medical Director policy

---

**Adult with SBP < 90 mmHg AND/OR signs of poor perfusion**

- ABCs
- Complete set of vital signs
- Full monitoring
- O₂ via NRB facemask @ 15L/min
- IV access
- ALS transport

---

**Signs of poor perfusion?**

- Altered mental status
- Tachycardia
- Cool, clammy skin
- Venous lactate > 4 (see below)

---

**Recheck and monitor**

If patient remains asymptomatic and clinically stable, treatment may not be necessary

---

**For ongoing hypotension, poor perfusion or pulmonary edema, consider vasopressor infusion**

---

**If patient at risk for adrenal insufficiency, see Adrenal Insufficiency protocol**

---

**Adrenal Insufficiency**

Patients at risk include:

- Chronic steroid use
- Addison’s disease
- Congenital adrenal hyperplasia
- Other patients identified as such by family, medical record, or physician note

---

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4061 ADRENAL INSUFFICIENCY PROTOCOL

Patient at risk for adrenal insufficiency (Addisonian crisis):
- Identified by family or medical alert bracelet
- Chronic steroid use
- Congenital Adrenal Hyperplasia
- Addison’s disease

Assess for signs of acute adrenal crisis:
- Pallor, weakness, lethargy
- Vomiting, abdominal pain
- Hypotension, shock
- Congestive heart failure

All symptomatic patients:
- Check blood glucose and treat hypoglycemia, if present
- Start IV and give oxygen
- Give NS bolus IV 20 mL/kg up to 2 liters

Does patient have hypotension and signs of poor perfusion?
- Altered mental status
- Tachycardia
- Cool, clammy skin

Yes

Give corticosteroid

- Repeat 20 mL/kg NS bolus, as needed
- Continue to monitor for development of hypoglycemia
- If otherwise considering administration of corticosteroid contact base for consult
- Monitor 12 lead ECG for signs of hyperkalemia

No

Corticosteroid Administration

- Adult (Age 12 years or older):
  - Methylprednisolone 125 mg IV/IM x 1

- Pediatric (age < 12 years):
  - Methylprednisolone 2 mg/kg IV/IM up to a maximum dose of 125 mg x 1

If the patient is confirmed to have a disease (such as congenital adrenal hyperplasia or chronic use of systemic steroids) that could lead to acute adrenal insufficiency or Addisonian crisis, then the administration of steroids may be life-saving and necessary for reversing shock or preventing cardiovascular collapse.

Patients at risk for adrenal insufficiency may develop Addisonian crisis when under physiologic stress which would not lead to cardiovascular collapse in normal patients. Such triggers may include trauma, dehydration, infection, myocardial ischemia, etc.

If no corticosteroid is available during transport, notify receiving hospital of need for immediate corticosteroid upon arrival.

Under Chapter 2 Rule: specialized prescription medications to address an acute crisis may be given by all levels with a direct VO, given the route of administration is within the scope of the provider. This applies to giving hydrocortisone for adrenal crisis, for instance if a patient or family member has this medication available on scene. Contact base for direct verbal order.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Scene Safety
A. Scene safety and provider safety are a priority. Consider police contact if scene safety is a concern.
B. Refer to restraint protocol as needed, especially as it relates to A.

Specific Information Needed
A. Obtain history of current event; inquire about recent crisis, toxic exposure, drugs, alcohol, emotional trauma, and suicidal or homicidal ideation.
B. Obtain past history; inquire about previous psychiatric and medical problems, medications.

Specific Objective Findings
A. Evaluate general appearance
   1. E.g.: Well groomed, disheveled, debilitated, bizarrely dressed
B. Evaluate vital signs.
   1. Is a particular toxidrome suggested, e.g.: sympathomimetic?
C. Note medic alert tags, breath odors suggesting intoxication.
D. Determine ability to relate to reality.
   1. Does the patient know who she is, where she is, who you are and why you are there?
   2. Does the patient appear to be hallucinating or responding to internal stimuli?
E. Note behavior. Consider known predictors of violence:
   1. Is the patient male, intoxicated, paranoid or displaying aggressive or threatening behavior or language?

Treatment
A. If patient agitated or combative, see Agitated/Combative Patient Protocol
B. Attempt to establish rapport
C. Assess ABCs
D. Transport to closest Emergency Department
E. Be alert for possible elopement
F. Consider organic causes of abnormal behavior (trauma, overdose, intoxication, hypoglycemia)
G. If patient restraint considered necessary for patient or EMS safety, refer to Restraint Protocol.
H. Check blood sugar
I. If altered mental status or unstable vital signs:
   1. Administer oxygen.
   2. Establish venous access.
   3. Refer to Universal Altered Mental Status Protocol.

Mental Health Holds
A. If a patient has an isolated mental health complaint (e.g. suicidality), and does not have a medical complaint or need specific medical intervention, then that patient may be appropriately transported by law enforcement according to their protocols.
B. If a patient has a psychiatric complaint with associated illness or injury (e.g. overdose, altered mental status, chest pain, etc), then the patient should be transported by EMS
C. If a patient with a psychiatric complaint is intoxicated or otherwise lacks decision making capacity for any other reason then no Mental Health Hold is needed and such a patient should be brought to an emergency department for evaluation and stabilization with implied consent.
D. If EMS is called to evaluate a patient with an isolated psychiatric complaint who is not

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
intoxicated, or otherwise lacking decision making capacity, and who refuses treatment or transport, and law enforcement are not willing to transport patient, then EMS should contact agency Base Station for medical consult with BASE PHYSICIAN.

E. If there is a reasonable concern for suicidal or homicidal ideation, or grave disability from another mental health condition, then BASE PHYSICIAN may give a verbal order placing the patient on a Mental Health Hold and direct EMS personnel to transport the patient against his or her will in accordance with Colorado State statutes. The physician’s name, and time and date of the Mental Health Hold must be recorded on the PCR. Effort should be made to obtain consent for transport from the patient, and to preserve the patient’s dignity throughout the process.

F. A patient being transported on a Mental Health Hold may be transported to any appropriate receiving emergency department, as it may not be operationally feasible to transport exclusively to the Base Station hospital, although this is preferred if time and conditions allow.

G. It is expected that receiving facilities will receive such patients and perform an appropriate evaluation to determine if continuation of a Mental Health Hold is indicated at the time of their assessment.

H. Although there is always a risk of accusations of kidnapping or assault in such cases, such accusations are extremely rare, and the Denver Metropolitan EMS Medical Directors feel strongly that the risk of abandonment of a potentially suicidal or otherwise gravely impaired patient far outweigh any theoretical risk of allegations of kidnapping when actions are taken in the interest of patient safety.

Specific Precautions

A. Psychiatric patients often have an organic basis for mental disturbances. Be suspicious of hypoglycemia, hypoxia, head injury, intoxication, or toxic ingestion.

B. If emergency treatment is unnecessary, do as little as possible except to reassure while transporting. Try not to violate the patient's personal space.

C. If the situation appears threatening, consider a show of force involving police before attempting to restrain.

D. Beware of weapons. These patients can become very violent.

E. An EMT, AEMT, Intermediate or paramedic may initiate a Mental Health Hold only by direct verbal order from the BASE PHYSICIAN.

F. Document name of BASE PHYSICIAN.
4075 AGITATED/COMBATIVE PATIENT PROTOCOL

**General Guideline:**
Emphasis should be placed on scene safety, appropriate use of restraints and aggressive treatment of the patient’s agitation.

**Excited Delirium Syndrome**
These patients are truly out of control and have a life-threatening medical emergency they will have some or all of the following sx:
- Paranoia, disorientation, hyper-aggression, hallucination, tachycardia, increased strength, hyperthermia

**Consider Cause of Agitation:**
Both benzodiazepines and butyrophenones (e.g. haloperidol) are acceptable options for agitated patients. In certain clinical scenarios individual medications may be preferred
- ETOH (butoyrophene)
- Sympathomimetic (benzo)
- Psych (butoyrophene)
- Head injury (butoyrophene)

- Reassess ABCs post sedation
- High flow O₂
- Start 2 large bore IVs as soon as may be safely accomplished
- Administer 2 liters NS bolus

Start external cooling measures
- Full cardiac, SpO₂, EtCO₂ (if available) monitoring and rapid transport

- Give benzodiazepine
- Up to a total of 3 doses may be given as a standing order. Goal is rapid tranquilization in order to minimize time struggling

- Complete Restraint Protocol

**Restraints**
No transport in hobble or prone position. Do not inhibit patient breathing, ventilations

**Patient is agitated and a danger to self or others**
- Attempt to reasonably address patient concerns
- Assemble personnel

**Assume the patient has a medical cause of agitation and treat reversible causes**

**Does patient have signs of the Excited Delirium Syndrome?**

**Patient does not respond to verbal de-escalation techniques**

**Restraint Protocol**
Obtain IV access as soon as may be safely accomplished

**Still significantly agitated?**

**Sedate**
- Consider cause of agitation
- Options: benzodiazepine or butyrophenone

**Still significantly agitated?**

- Repeat sedation dose
- If still significantly agitated 5 minutes after 2nd dose sedative, Contact Base

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Purpose:

1. Guideline for transport of patients in handcuffs placed by law enforcement

Guideline:

1. Handcuffs are only to be placed by law enforcement. EMS personnel are not permitted to use handcuffs.
2. Request that law enforcement remain with the patient in the ambulance, if possible. If not possible, request that police ride behind ambulance so as to be readily available to remove handcuffs if needed in an emergency situation to facilitate medical care of the patient.
3. EMS personnel are not responsible for the law enforcement hold on these patients.
4. Handcuffed patients will not be placed in the prone position.
5. Handcuffs may be used with spinal immobilization. Medical priorities should take priority in the positioning of the handcuffs.
4080 CHILDBIRTH PROTOCOL

Overview:
- EMS providers called to a possible prehospital childbirth should determine if there is enough time to transport expectant mother to hospital or if delivery is imminent
- If imminent, stay on scene and immediately prepare to assist with the delivery

ABCs
- O2 15 liters via NRB
- IV access

Obtain obstetrical history (see adjacent)

If suspected imminent childbirth:
- Allow patient to remain in position of comfort
- Visualize perineum
- Determine if there is time to transport

Delivery is imminent if there is crowning or bulging of perineum

Emergency Childbirth Procedure
- If there is a prolapsed umbilical cord or apparent breech presentation, go to obstetrical complications protocol and initiate immediate transport
- For otherwise uncomplicated delivery:
  - Position mother supine on flat surface, if possible
  - Do not attempt to impair or delay delivery
  - Support and control delivery of head as it emerges
  - Protect perineum with gentle hand pressure
  - Check for cord around neck, gently remove from around neck, if present
  - Suction mouth, then nose of infant as soon as head is delivered
  - If delivery not progressing, baby is “stuck”, see obstetrical complications protocol and begin immediate transport
  - As shoulders emerge, gently guide head and neck downward to deliver anterior shoulder. Support and gently lift head and neck to deliver posterior shoulder
  - Rest of infant should deliver with passive participation – get a firm hold on baby
  - Keep newborn at level of mother’s vagina until cord stops pulsating and is double clamped

Critical Thinking:
- Normal pregnancy is accompanied by higher heart rates and lower blood pressures
- Shock will be manifested by signs of poor perfusion
- Labor can take 8-12 hours, but as little as 5 minutes if high PARA
- The higher the PARA, the shorter the labor is likely to be
- High risk factors include: no prenatal care, drug use, teenage pregnancy, DM, htn, cardiac disease, prior breech or C section, preeclampsia, twins
- Note color of amniotic fluid for meconium staining

Postpartum Care Infant
- Suction mouth and nose only if signs of obstruction by secretions
- Respirations should begin within 15 seconds after stimulating reflexes. If not, begin artificial ventilations at 30-40 breaths/min
- If apneic, cyanotic or HR < 100, begin neonatal resuscitation
- Dry baby and wrap in warm blanket
- After umbilical cord stops pulsating, double clamp 6” from infant abdominal wall and cut between clamps with sterile scalpel. If no sterile cutting instrument available, lay infant on mother’s abdomen and do not cut clamped cord
- Document 1 and 5 minute APGAR scores

Postpartum Care Mother
- Placenta should deliver in 20-30 minutes. If delivered, collect in plastic bag and bring to hospital. Do not pull cord to facilitate placenta delivery and do not delay transport awaiting placenta delivery
- If the perineum is torn and bleeding, apply direct pressure with sanitary pads
- Postpartum hemorrhage – see obstetrical complications protocol
- Initiate transport once delivery of child is complete and mother can tolerate movement

Specific Information Needed:
- Obstetrical history:
  - Number of pregnancies (gravida)
  - Live births (PARA)
  - Expected delivery date
  - Length of previous labors
  - Narcotic use in past 4 hours

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
4081 OBSTETRICAL COMPLICATIONS

For All Patients with obstetrical complications

- Do not delay: immediate rapid transport
- Give high-flow oxygen
- Start IV en route if time and conditions allow. Treat signs of shock w. IV fluid boluses per Medical Hypotension/Shock Protocol

Possible actions for specific complications (below)

- The following actions may not be feasible in every case, nor may every obstetrical complication be anticipated or effectively managed in the field. These should be considered “best advice” for rare, difficult scenarios. In every case, initiate immediate transport to definite care at hospital

**Prolapsed Umbilical Cord**

- Discourage pushing by mother
- Position mother in Trendelenberg or supine with hips elevated
- Place gloved hand in mother’s vagina and elevate the presenting fetal part off of cord until relieved by physician
- Feel for cord pulsations
- Keep exposed cord moist and warm

**Breech Delivery**

- Never attempt to pull infant from vagina by legs
- IF legs are delivered gently elevate trunk and legs to aid delivery of head
- Head should deliver in 30 seconds. If not, reach 2 fingers into vagina to locate infant’s mouth. Press vaginal wall away from baby’s mouth to access an airway
- Apply gentle abdominal pressure to uterine fundus
- IF infant delivered see childbirth protocol – Postpartum care of infant and mother

**Complications of Late Pregnancy**

**3rd Trimester Bleeding (6-8 months)**

- High flow O₂ via NRB, IV access
- Suspect placental abruption or placenta previa
- Initiate rapid transport
- Position patient on left side
- Note type and amount of bleeding
- IV NS bolus for significant bleeding or shock

**Eclampsia/Toxemia**

- High flow O₂ via NRB, IV access
- SBP > 140, DBP > 90, peripheral edema, headache, seizure
- Transport position of comfort
- Treat seizures with Magnesium Sulfate 2 gm slow IV push followed by 4 gm IV over 15-30 minutes (total 6 gm)
- See seizure protocol

**Shoulder Dystocia**

- Support baby’s head
- Suction oral and nasal passages
- DO NOT pull on head
- May facilitate delivery by placing mother with buttocks just off the end of bed, flex her thighs upward and gentle open hand pressure above the pubic bone
- IF infant delivered see childbirth protocol – Postpartum care of infant and mother

**Postpartum Hemorrhage**

- Massage abdomen (uterine fundus) until firm
- Initiate rapid transport
- Note type and amount of bleeding
- Treat signs of shock with IV fluid boluses

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5000 GENERAL TRAUMA CARE

- BSI
- Scene safety
- Consider mechanism
- Consider need for additional resources

- General impression
- ABCs and LOC
- Rapid Trauma Assessment
- Prepare for immediate transport
- SAMPLE history

- Give high flow oxygen
- Assist ventilations and manage airway as indicated
- Spinal immobilization if indicated

Control exsanguinating hemorrhage:
- Direct pressure
- Tourniquet protocol if indicated
- Pelvic stabilization if indicated

Assess disability and limitation:
- Brief neuro assessment
- Extremity splinting if indicated

- Rapid transport to appropriate Trauma Center
- Large bore IV, 2nd if unstable
- Consider IV fluid bolus 20cc/kg if unstable or suspected significant injuries. See Traumatic Shock Protocol
- Monitor vital signs, ABCs, neuro status, GCS
5005 SPECIAL TRAUMA SCENARIOS PROTOCOL

See General Trauma Care Protocol 5000

Sexual Assault

Confine history to pertinent medical needs

• Provide same-sex provider if possible
• Respect patient’s emotional needs

Don’t judge, accuse or confront victim

Protect evidence: No washing or changing clothes

Coordinate transport destination with law enforcement

Abuse/neglect

Observe pt’s behavior around caregivers

Watch out for:
• Injury inconsistent with stated mechanism
• Delayed treatment
• Spreading blame
• Conflicting stories
• Prior healing injuries

Don’t judge, accuse or confront victim or suspected assailant

Transport patient if suspected abuse or neglect, no matter how apparently minor the injury

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5006 TRAUMA IN PREGNANCY

See General Trauma Care Protocol 5000

Pregnant Trauma (EGA < 20 weeks)

- Priority is mother.
- Transport all patients with any thoracic, abdominal, pelvic injury or complaint.

Pregnant Trauma (EGA ≥ 20 weeks)

- Priority is mother.
- Transport all patients.
- Assure hospital is aware of pregnancy and EGA

Patients with any thoracic, abdominal, or pelvic complaint or injury may require prolonged fetal monitoring in hospital, even if asymptomatic at time of evaluation, and even for seemingly minor mechanism

- Avoid supine position:
  - Place in left lateral recumbent position if possible
  - If immobilized tilt backboard 15 to 30 degrees to the left side

- Interpret VS with caution. Pregnant patient has:
  - Increased heart rate
  - Decreased blood pressure
  - Increased blood volume

Estimated Gestational Age (EGA)

If EGA > 20 weeks, consider two patients: mother and fetus. Estimation of gestational age may be made based on fundal height by palpating for top of uterus:

If uterus is at umbilicus then EGA > 20 weeks

Estimation by Last Menstrual Period:
Due Date = LMP + 9 months + 7 days
EGA = due date – current date

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5010 ADULT (AGE ≥ 12 YEARS) TRAUMATIC PULSELESS ARREST

GENERAL TRAUMA CARE PROTOCOL

Are there obvious signs of death OR the presence of non-survivable injuries?

(SEE BELOW)

Yes → Contact Base for Field Pronouncement

No → Consider MOI

(isolated GSW to head treated similar to blunt trauma)

Blunt Trauma

Unwitnessed arrest?

(At no point definite signs of life in field)

No, witnessed arrest by EMS → Contact Base for Field Pronouncement

Penetrating Trauma

Rapid transport

General Trauma Care

Initiate Basic Life Support

CPR with ventilations

IV access with NS bolus en route

Consider bilateral needle chest decompression

NON-SURVIVABLE INJURIES

- Decapitation
- 90% 3° burns
- Evidence of massive head or thoraco-abdominal trauma

DOCUMENT:

- General impression
- Mechanism: blunt vs. penetrating
- Time and duration of arrest
- Were vital signs present at any time?

TREAT INJURIES PER PROTOCOL

COMPLETE GENERAL TRAUMA CARE

RAPID TRANSPORT TO APPROPRIATE TRAUMA CENTER

CONSIDER FIELD PRONOUNCEMENT IF suspected arrest time > 10 minutes and no signs of life

APPROVED BY DENVER METRO EMS MEDICAL DIRECTORS JULY 1, 2015. NEXT REVIEW JANUARY 2016
5015 ADULT (AGE ≥ 12 YEARS) TRAUMATIC SHOCK PROTOCOL

Trauma w. suspected serious injury and/or signs of shock →

General Trauma Care Protocol →

- Administer oxygen
- Large bore IV
- 2nd IV preferred

SBP < 90 and/or definite signs of shock?

Yes →

- IV NS bolus 20 mL/kg
- Consider IO per protocol

No →

- Treat en route
- Complete General Trauma Care
- Keep patient warm

Monitor:
- ABCs, VS, mental status
- Rapid transport to appropriate trauma center

Repeat NS bolus 20 mL/kg as needed based on mental status and perfusion → Reassess →

Chest needle decompression if arrest or impending arrest

Shock is defined as impaired tissue perfusion and may be manifested by any of the following:
- Altered mental status
- Tachycardia
- Poor skin perfusion
- Low blood pressure

Traditional signs of shock may be absent early in the process, therefore, maintain a high index of suspicion and be vigilant for subtle signs of poor perfusion

Prehospital End-Points of Fluid Resuscitation:

Over aggressive resuscitation with IV fluid before hemorrhage is controlled may worsen bleeding, hypothermia and coagulopathy.

Do not withhold IV fluids in a critically injured patient, but give judiciously with goal to improve signs of perfusion and mental status rather than to achieve a “normal” blood pressure.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5020 AMPUTATIONS

Complete Amputation

Partial Amputation

Apply tourniquet without delay

Control with direct pressure to bleeding area or vessel

Life-threatening bleeding

Non-Life-threatening bleeding

Amputated part:
- Wrap in moist, sterile dressing
- Place in sealed plastic bag
- Place bag in ice water
- Do not freeze part

Stump:
- Cover with moist sterile dressing covered by dry dressing

Partial Amputation:
- Cover with moist sterile dressing
- Splint near-amputated part in anatomic position

Treat severe pain with opioid as needed

• Large bore IV
• If hypotensive, treat per Traumatic Shock Protocol
• Document neurovascular exam

• Monitor and transport to appropriate Trauma Center
• Treat other injuries per protocol

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5030 HEAD TRAUMA PROTOCOL

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5040 FACE AND NECK TRAUMA

General Trauma Care Protocol

- Clear airway
- Rapid trauma assessment
- Spinal immobilization Protocol
- Assess for need for airway management

Laryngeal trauma*

Yes

Rapid transport

Avoid intubation if patient can be oxygenated by less invasive means

No

Severe airway Bleeding?

Yes

Direct pressure if appropriate

Consider ETI

- Nasal intubation relatively contraindicated with mid-face trauma.
- Avoid if mid-face grossly unstable

No

- Complete neuro exam
- Assess for subcutaneous air
- Cover/protect eyes as indicated
- Do not try to block drainage from ears, nose
- Save avulsed teeth in saline-soaked gauze, do not scrub clean

Transport ASAP to appropriate Trauma Center

- IV access en route
- Treat other injuries per protocol
- Suction airway as needed

- Consider opioid for pain control as needed

*Suspect laryngeal trauma with:

- Laryngeal tenderness, swelling, bruising
- Voice changes
- Respiratory distress
- Stridor

Spinal Immobilization not routinely indicated for penetrating neck injury

Penetrating injury is very rarely associated with unstable spinal column

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5050 ADULT SPINAL TRAUMA

**Signs of Spinal Cord Injury:**
- Any neurological complaint
- Sensory loss, weakness and/or paralysis
- Numbness, tingling or painful burning in arms, legs

**Spinal Immobilization not routinely indicated for penetrating neck injury**
*Penetrating injury is very rarely associated with unstable spinal column*

**General Trauma Care Protocol**
- Full spinal immobilization if suspected spine injury
- Document neuro assessments before and after immobilization
- Rapid transport to appropriate Trauma Center
- Large bore IV and consider 2nd line
- If BP < 90 and/or signs of shock, resuscitate per Traumatic Shock Protocol
- Complete patient assessment
- Treat other injuries per protocol
- Monitor for status changes

Monitor ABCs, VS, mental status, SpO₂, ETCO₂

Consider opioid for pain control

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5055 ADULT (AGE ≥ 12 YEARS) SPINAL PRECAUTIONS PROTOCOL

Does patient have/complain of any of the following:
• Midline C/T/L spine tenderness on palpation
• Neurologic complaints or deficits
• Other injuries which are potentially distracting
• Alteration in mentation or under influence of drugs or EtOH
• Barrier to evaluate for spinal injury (e.g. language or developmental barrier)

Yes \[\xrightarrow{\text{Place c-collar on patient and ask them to not move neck}}\] No \[\xrightarrow{\text{If NONE of above criteria, no spinal precautions required}}\]

Are there signs/symptoms of traumatic injury?

No

Yes

Did patient sustain ONLY penetrating trauma?

No

Yes

Is the patient ambulatory on scene at time of EMS arrival?

No

Yes

Is the patient able to comfortably lay still?

No

Patient does NOT require a backboard. Have them lie still on the gurney, which will provide sufficient spinal precaution

Yes

Immobilize using backboard or scoop & cervical collar with standard technique

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Suspected Spinal Injury

Are helmet and pads in place?

Yes

Are helmet and pads properly fitted and snug?

Yes

Do helmet and pads allow for neutral alignment of spine?

Yes

Is facemask removable in timely manner?

Yes

Is airway accessible with helmet in place?

Yes

Immobilize/Transport with helmet and pads in place

No

Standard immobilization techniques

No

Remove helmet and pads prior to transport

Overview

Do not remove helmet or shoulder pads prior to EMS transport unless they are interfering with the management of acute life threatening injuries.

The helmet and pads should be considered one unit therefore if one is removed then the other should be removed as well to assure neutral spine alignment.

All athletic equipment is not the same. Athletic Trainers on scene should be familiar with equipment in use and be able to remove facemask prior to, or immediately upon, EMS arrival.
5060 CHEST TRAUMA

- General Trauma Care Protocol
- Rapid transport to Trauma Center

Are you able to oxygenate and ventilate effectively?

- No
  - Airway management and assisted ventilations as indicated
  - Consider tension pneumothorax and chest needle decompression

- Yes
  - Rapid transport & stabilize in route
  - Occlusive dressings for sucking wounds

Penetrating trauma?

- Yes
  - Large bore IV and consider 2nd line
  - Splint with bulky dressing
  - Assess for need for assisted ventilations
  - Consider intubation if decompensating

- No
  - SBP < 90 and/or shock?

- Yes
  - Treat per traumatic shock protocol in route

- No
  - Flail Chest?

- Yes
  - Consider opioid for pain control
  - Monitor ABCs, VS, mental status, SpO2, ETCO2

- No
  - Consider opioid for pain control

Tension pneumothorax should be suspected with presence of the following:
- Unilateral absent breath sounds AND: JVD, hypotension, difficult/unable to ventilate
- Needle decompression is NEVER indicated for simple pneumothorax

End points of fluid resuscitation should be improved mental status and pulses, not necessarily a normal blood pressure. This is especially true for penetrating chest trauma.
5070 ABDOMINAL TRAUMA

- General Trauma Care Protocol
- Rapid transport to Trauma Center

- IV access
- Consider 2nd line if MOI significant

Penetrating trauma?

Yes → Cover wounds, viscera with saline moistened gauze dressing

No → Do not attempt to repack exposed viscera

SBP < 90 and/or shock?

Yes → Resuscitate per Traumatic Shock Protocol

No → Consider opioid for pain control

End points of fluid resuscitation should be improved mental status and pulses, not necessarily a normal blood pressure. This is especially true for abdominal trauma.

Monitor ABCs, VS, mental status, SpO2, ETCO2

Documentation
- MOI
- Time of injury
- Initial GCS

- Penetrating trauma
  - Weapon/projectile/trajectory

- Blunt vehicular trauma
  - Condition of vehicle
  - Speed
  - Ejection
  - Airbag deployment
  - Restraints, helmets

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
5090 BURNS

- General Trauma Care Protocol
- Rapid transport to Trauma Center

Stop burning process:
- Remove clothes if not adhered to patient’s skin
- Flood with water only if flames/smoldering present

Respiratory Distress
- Yes: Oxygen NRB 15 lpm
- Manage airway and assist ventilations as indicated
- Consider CO, CN

Evaluate degree and body surface are involved

Critical Burn*?
- Yes: Start 2 large-bore IVs
- Fluids per ABA recommendations (chart below)**

- No: IV NS TKO

- Remove rings, jewelry, constricting items
- Dress burns with dry sterile dressings
- Treat other injuries per protocol
- Cover patient to keep warm

Consider opioid for pain control

Monitor ABCs, VS, mental status, SpO2, ETCO2

** ABA Recommended Prehospital Fluid Therapy
14 and older: 500 mL/hr NS or LR
5 - 13 years: 250 mL/hr NS or LR
Younger than 5: 125 mL/hr D5W, NS or LR

Document:
- Type and degree of burn(s)
- % BSA
- Respiratory status
- Singed nares, soot in mouth
- SpO2
- PMH
- Confined space

*Critical Burn:
- 2º > 30% BSA
- 3º > 10% BSA
- Respiratory injury, facial burn
- Associated injuries, electrical or deep chemical burns, underlying PMH (cardiac, DM), age < 10 or > 50 yrs.

Types of Burns:
- Thermal: remove from environment, put out fire
- Chemical: brush off or dilute chemical. Consider HAZMAT
- Electrical: make sure victim is de-energized and suspect internal injuries
- Consider CO if enclosed space
- Consider CN if plastics, shock, pulseless arrest

Designated Regional Burn Centers
Consider direct transport of isolated burns if time and conditions allow
- Age ≤ 14 Children’s Hospital Colorado
- Age ≥ 15 University of Colorado Hospital

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
General Guideline:

A. Pediatric patients, defined as age < 12 years for the purpose of these protocols, have unique anatomy, physiology, and developmental needs that affect prehospital care. Because children make up a small percentage of total calls and few pediatric calls are critically ill or injured, it is important to stay attuned to these differences to provide good care. Therefore, CONTACT BASE early for guidance when treating pediatric patients with significant complaints, including abnormalities of vital signs. Pediatric emergencies are usually not preceded by chronic disease. If recognition of compromise occurs early, and intervention is swift and effective, the child will often be restored to full health.

Specific Considerations:

A. The following should be kept in mind during the care of children in the prehospital setting:
   1. Airways are smaller, softer, and easier to obstruct or collapse.
   2. Respiratory reserves are small. A minor insult like improper position, vomiting, or airway narrowing can result in major deficits in ventilation and oxygenation.
   3. Circulatory reserves are also small. The loss of as little as one unit of blood can produce severe shock in an infant. Conversely, it is difficult to fluid overload most children. You can be confident that a good hands-on circulation assessment will determine fluid needs accurately.
   4. Assessment of the pediatric patient can be done using your knowledge of the anatomy and physiology specific to infants and children.
   5. Listen to the parents' assessment of the patient's problem. They often can detect small changes in their child's condition. This is particularly true if the patient has chronic disease.
   6. The proper equipment is very important when dealing with the pediatric patient. A complete selection of pediatric airway management equipment, IV catheters, cervical collars, and drugs has been mandated by the state. This equipment should be stored separately to minimize confusion.
6005 PEDIATRIC SEIZURE (< 12 YEARS)

- Support ABCs:
  - Give oxygen
  - Rule out or treat hypoglycemia
  - Universal seizure precautions (see below)
  - Consider the cause (see below)

**Actively Seizing?**

- If seizure brief and self-limited, treatment not necessary
- If prolonged (e.g.: > 5 min) or recurrent sz, then treat as follows:

  **Give benzodiazepine**

  **Actively seizing after 5 minutes?**

  - Yes
    - Establish IV access if not already in place
    - Repeat benzodiazepine

  **Actively seizing after 5 minutes?**

  - No
    - Check pulse and reassess ABCs
    - Give supplemental oxygen

  **Actively seizing after 5 minutes?**

  - Yes
    - Transport and monitor ABCs, vital signs, and neurological condition
    - Complete head to toe assessment

**Common Causes of Seizures**

- Epilepsy
- Febrile seizure
- Trauma/NAT
- Hypoglycemia
- Intracranial hemorrhage
- Overdose (TCA)
- Meningitis
- Stimulant use (cocaine, meth)

**Universal Seizure Precautions**

- Ensure airway patency, but do not force anything between teeth. NPA may be useful
- Give oxygen
- Suction as needed
- Protect patient from injury
- Check pulse immediately after seizure stops
- Keep patient on side

**Document:**

- Document: Seizure history: onset, time interval, previous seizures, type of seizure
- Obtain medical history: head trauma, diabetes, substance abuse, medications, compliance with anticonvulsants, pregnancy

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
6010 PEDIATRIC (AGE < 12 YEARS) CARDIAC ARREST-GENERAL PRINCIPLES

General Guideline:
A. Pediatric cardiac arrest more frequently represents progressive respiratory deterioration or shock rather than primary cardiac etiologies. Unrecognized deterioration may lead to bradycardia, agonal breathing, and ultimately asystole. Resulting hypoxic and ischemic insult to the brain and other vital organs makes neurologic recovery extremely unlikely, even in the doubtful event that the child survives the arrest. Children who respond to rapid intervention with ventilation and oxygenation alone or to less than 5 minutes of advanced life support are much more likely to survive neurologically intact. Therefore, it is essential to recognize the child who is at risk for progressing to cardiopulmonary arrest and to provide aggressive intervention before asystole occurs.

Specific Information Needed For Patient Care Report
A. Onset (witnessed or unwitnessed), preceding symptoms, bystander CPR, downtime before CPR and duration of CPR
B. Past History: medications, medical history, suspicion of ingestion, trauma, environmental factors (hypothermia, inhalation, asphyxiation)

Document Specific Objective Findings
A. Unconscious, unresponsive
B. Agonal, or absent respirations
C. Absent pulses
D. Any signs of trauma, blood loss
E. Skin temperature

General Treatment Guidelines
A. Treat according to Pediatric BLS and ALS pulseless arrest algorithms
B. Primary cardiac arrest from ventricular arrhythmia, while less common than in adults, does occur in children. If history suggests primary cardiac event (e.g.: sudden collapse during exercise), then rapid defibrillation is most effective treatment
C. Most pediatric pulseless arrest is the result of primary asphyxial event, therefore initial sequence is chest compressions with ventilations, unlike adult pulseless arrest
D. Call for ALS assistance if not already on scene or responding

General Guidelines: Chest Compressions for 2 Rescuers
Once advanced airway in place, chest compressions should be given continually with ventilations at 8-10/minute

Neonate (≤ 1 month old) Infant and Child (1 month to 12 years old)
• 1 cycle of CPR = 3:1 chest compressions: breaths. A. 1 cycle of CPR = 15:2 chest compressions: breaths
• Push hard and fast at a compression rate of 100/minute
• Minimize interruption to chest compressions
  a. Continue CPR while defibrillator is charging, and resume CPR immediately after all shocks. Do not check pulses except at end of CPR cycle and if rhythm is organized at rhythm check

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
6010 PEDIATRIC (AGE < 12 YEARS) CARDIAC ARREST-GENERAL PRINCIPLES

b. Increase in compression interruption correlates with decrease in likelihood of successful defibrillation
• Ensure full chest recoil
  a. Represents diastolic phase for cardiac filling due to negative intrathoracic pressure
• Avoid hyperventilation
  a. Associated with barotrauma and air trapping
  b. Makes CPR less effective by inhibiting cardiac output by increasing intrathoracic pressure and decreasing venous return to the heart
• Rotate compressors every 2 minutes during rhythm checks

General Guidelines: Defibrillation

A. First shock delivered at 2 J/kg biphasic
B. All subsequent shocks delivered at 4 J/kg biphasic

General Guidelines: Ventilation during CPR

A. Do not interrupt chest compressions and do not hyperventilate
B. Contrary to adult cardiac arrest, pediatric arrest is much more likely to be asphyxial and prolonged. During this period, blood continues to flow to the tissues causing oxygen saturation to decrease and carbon dioxide to increase. Pediatric patients need both prompt ventilation and chest compressions.
C. Hyperventilation decreases effectiveness of CPR and worsens outcome

General Guidelines: Timing Of Placement Of Advanced Airway

A. **BVM is preferred method of ventilation in all pediatric patients age < 8 years**
B. A supraglottic airway (e.g. King) may be placed at any point in resuscitation in patients ≥ 8 years old and may be considered equivalent to, but not superior to, BVM for ages 8-12
C. Do not hyperventilate
D. Always confirm advanced airway placement by objective criteria: ETCO₂
  a. Use continuous waveform capnography if available

General Guidelines: Pacing

A. Effectiveness of transcutaneous pediatric pacing has not been established and is not recommended

General Guidelines: ICD/Pacemaker patients

A. If cardiac arrest patient has an implantable cardioverter defibrillator (ICD) or pacemaker: place pacer/defib pads at least 1 inch from device. Biaxillary pad placement may be used

Special Notes:

A. Consider reversible causes of cardiac arrest (“Hs And Ts”):

6015 PEDIATRIC (AGE < 12 YEARS) PULSELESS ARREST BLS/AED ALGORITHM

Unresponsive and not breathing or only gasping

EMT AEMT EMT-I Paramedic

High quality CPR
- Rate 100/min
- Compression depth 1 ½ inches in infants, 2 inches in children
- Allow complete chest recoil after compression
- Minimize interruptions of chest compressions
- Avoid excessive ventilation

Check pulse (< 10 sec)
Is there a definite pulse?

Definite Pulse
Check Rate

No Pulse

Pulse > 60
- Give 1 breath every 3 seconds
- Recheck pulse every 2 minutes

Pulse < 60
- Infant/child: start CPR
- Age > 11: start CPR if signs of poor perfusion
- Go to Peds Bradycardia Algorithm
- Recheck pulse every 2 minutes

Neonate (< 1 month)
- Start CPR cycles in 3:1
- Go to Neonatal resuscitation

Infant/Child (> 1 month)
- Start CPR cycles in 15:2

Child > 11 years
- Follow adult pulseless arrest algorithm

Apply AED/Defibrillator
- Use pediatric system if available for ages 1 year to 8 years
- Use defibrillator for < 1 year (may use AED if not available)

Check Rhythm
Shockable rhythm?

Shockable
- Give 1 shock
- Resume CPR immediately for 2 minutes after shock
- Check rhythm every 2 minutes

Not Shockable
- Resume CPR immediately for 2 minutes
- Check rhythm every 2 minutes

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**6020 PEDIATRIC (AGE < 12 YEARS) TACHYCARDIA WITH POOR PERFUSION**

1. **Tachycardia with poor perfusion**
   - Identify and treat underlying cause
     - ABCs and high flow oxygen
     - Cardiac monitor
     - IV/IO access
   - 12-lead ECG

2. **Evaluate rhythm by 12-lead ECG or monitor**
   - Narrow (≤ 0.09 sec)
   - Wide (> 0.09 sec)

3. **Evaluate QRS duration**
   - Probable Sinus Tachycardia
     - Compatible hx and consistent with suspected cause (e.g. dehydration, infection)
     - P waves present, normal
     - Constant PRI
     - Infants: rate usually < 220
     - Children: rate usually < 180
     - Search for and treat underlying cause:
       - e.g.: dehydration, fever, hypoxia, hypovolemia, pain, anxiety
   - Probable AVNRT (historically "PSVT")
     - Compatible hx (vague, non-specific); hx of abrupt rate changes
     - P waves absent/abnormal
     - HR not variable
     - Infants: rate usually ≥ 220
     - Children: rate usually ≥ 180
   - Possible Ventricular Tachycardia
     - Cardiopulmonary compromise?
       - Hypotension, altered mental status or other signs of shock
         - Yes
         - Synchronized cardioversion
           • Give benzodiazepine for sedation if possible without delaying cardioversion
           • Administer doses of 2 J/kg.
         - No
         - Contact Base before giving adenosine
           • Contact Base for consultation before giving adenosine in a pediatric patient
           • May consider adenosine if rhythm regular and QRS monomorphic
         - Yes
         - Synchronized cardioversion

4. **Cardiopulmonary compromise?**
   - Hypotension, altered mental status or other signs of shock
     - Yes
     - Synchronized cardioversion
     - No
     - Contact Base before giving adenosine
Bradycardia with pulse and poor perfusion

Ensure adequate oxygenation and ventilation
- Maintain patent airway; assist breathing as needed
- Assist breathing as needed
- Give oxygen

Consider and treat other underlying causes

Persistent hypotension, altered mental status or signs of poor perfusion?
- Support ABCs
- Monitor VS
- Observe for deterioration
- Base Contact if deteriorates

If pulses, perfusion and respirations are adequate, no intervention indicated. Monitor and transport

CPR if HR < 60/min with poor perfusion despite oxygenation and ventilation

Yes
- Bradycardia persists?
  - Yes
    - Epinephrine IV/IO
    - Atropine IV/IO for increased vagal tone or AV block
    - Treat underlying causes
    - Consider Pacing
  - No
    - After 2 minutes reevaluate patient for persistent brady and signs of compromise. check airway, oxygen source and effectiveness of ventilations

No

Bradycardia: Consider any HR < 60 in an ill child abnormal regardless of age

Signs of Poor Perfusion:
- Cool, pale extremities
- Prolonged CRFT (> 2 sec)
- Lethargy/alt mental status
- Hypotension:
  - < 1 month: < 60 mmHg
  - 1 month-1 yrs: < 70 mmHg
  - >1 yrs: < 70 + (2x age) mmHg

If pulseless arrest develops, go to Pulseless arrest algorithm

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
General Considerations
(From 2010 AHA Guidelines)

- Newborn infants who do not require resuscitation can be identified generally based on 3 questions:
  - Term gestation?
  - Crying or breathing?
  - Good muscle tone?
- If answer to all 3 questions is "yes" then baby does not require resuscitation and should be dried, placed skin-to-skin on mother and covered to keep warm.
- If answer to any of 3 questions is "no" then infant should receive 1 or more of following 4 categories of intervention in sequence:
  - Initial steps in stabilization (warm, clear airway, dry, stimulate)
  - Ventilation
  - Chest compression
  - Administration of epinephrine and/or volume expansion
- It should take approx. 60 seconds to complete initial steps.
- The decision to progress beyond initial steps is based on an assessment of respirations (apnea, gasping, labored or unlabored breathing) and heart rate (>100 bpm).

Assisting Ventilations:
- Assist ventilations at rate of 40-60 breaths per minute to maintain HR > 100.

Chest compressions:
- Indicated for HR < 60 despite adequate ventilation w. supplemental O2 for 30 seconds.
- 2 thumb – encircling hands technique preferred.
- Allow chest recoil.
- Coordinate with ventilations so not delivered simultaneously.
- 3:1 ratio of compressions to ventilations w. exhalation occurring during 1st compression after each ventilation.

General Considerations:
A. A neonate refers to a newly born child under the age of 30 days. While most neonates transition to post-natal life without difficulty, 10% will require medical assistance. Respiratory insufficiency is the most common complication observed in the newly born.
B. Neonates born precipitously may exhibit signs of stress such as apnea, grunting respirations, lethargy or poor tone
   1. Provide warmth, bulb suction mouth and then nose, and dry the infant
   2. If breathing spontaneously, HR >100 and infant is vigorous, continue to monitor
   3. If apneic, cyanotic, lethargic, or HR <100, provide 100% oxygen via BVM ventilations at a rate of 40-60 bpm
   4. If HR < 60, begin CPR at 3:1 compression:ventilation ratio.
C. For neonates who do not respond to initial interventions as above:
   1. Obtain blood glucose level and if < 60, administer dextrose IV/IO (D10 4 mL/kg)
   2. Administer epinephrine IV for persistent HR < 60
   3. Consider hypovolemia and administer 10-20ml/kg NS over 5-10 minutes
D. Neonates with congenital heart disease may not be detected prior to hospital discharge after delivery. Consider a cardiac cause of shock in the neonate who remains hypoxic or has persistent cyanosis despite 100% oxygen. These neonates may decompensate precipitously and fluid administration should be used judiciously (10ml/kg NS)
E. Newborns are at high risk for hypothermia. Provide early warming measures, keep covered as much as possible (especially the head) and increase the temperature in the ambulance
F. Acrocyanosis (cyanosis of only the hands and feet) is normal in newborns and does not require intervention
G. Prolonged apnea without bradycardia or cyanosis may indicate respiratory depression caused by narcotics. However, naloxone should be avoided in infants of a known or suspected narcotic-addicted mother as this may induce a withdrawal reaction. Respiratory support alone is recommended
H. Obtain pregnancy history, gestational age of the neonate, pregnancy complications, and any illicit drug use during pregnancy.
6030 PEDIATRIC (AGE < 12 YEARS) PULSELESS ARREST ALS ALGORITHM

**BLS Sequence**
- Pediatric Pulseless Arrest
  - Start CPR
  - Get AED
  - Check rhythm & shock if indicated.
  - Repeat every 2 min

**ALS Sequence**
- EMT
  - Start CPR
  - Attach manual defibrillator
  - Give O₂
- AEMT
  - Shockable Rhythm?
    - Yes
      - VT/VF
      - Shock + CPR 2 min
      - IV/IO
      - Epinephrine
      - No
        - Shockable Rhythm?
          - Yes
            - A Shock + CPR 2 min
            - Epinephrine every 3-5 min
            - No
              - Shockable Rhythm?
                - Yes
                  - B CPR 2 min
                  - IV/IO
                  - Epinephrine
                  - No
                    - Shockable Rhythm?
                      - Yes
                        - Go to Box A
                      - No
                        - Shockable Rhythm?
                          - Yes
                            - A Shock + CPR 2 min
                            - Epinephrine every 3-5 min
                            - Amiodarone
                            - Treat reversible causes

**CPR, Ventilation and Advanced Airway:**
- BVM preferred for all patients < 8 years old and is appropriate as primary means of ventilation in all pediatric patients
- An appropriately-sized supraglottic airway (e.g. King) may be placed if available at any point in resuscitation in children ≥ 8 years old
- No intubation for cardiac arrest < age 12 unless other methods, i.e. BVM, supraglottic airway, are unsuccessful
- If no advanced airway, alternate ventilations and compressions in 15:2 ratio
- If advanced airway in place, ventilate continuously at 8-10 breaths/minute
- Avoid excessive ventilation

**Defibrillation:**
- 1st shock 2 J/kg, subsequent shocks 4 J/kg
- EMT + AEMT use AED
- Intermediate and Paramedic use manual defibrillator

**ROSC:**
- Return of spontaneous circulation
- Pulse and blood pressure

**Regarding where to work arrest and presence of family members**
- CPR in a moving ambulance or pram is ineffective
- In general, work cardiac arrest on scene either to return of spontaneous circulation (ROSC), or to field pronouncement, unless scene unsafe
- Family presence during resuscitation is preferred by most families, is rarely disruptive, and may help with grieving process for family members
- Family presence during resuscitation is recommended, unless disruptive to resuscitation efforts
- Contact base for termination of resuscitation

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
6040 CARE OF THE CHILD WITH SPECIAL NEEDS

General Guideline:

Children with special health care needs include those with chronic physical, developmental, behavioral or emotional health issues. These children often have complex medical needs and may be technology-dependent. Parents or caregivers for such children can be a wealth of knowledge about their child’s care and may carry a reference care sheet. Contact Base station for any concerns.

A. Under Chapter 2 Rule: specialized prescription medications to address an acute crisis may be given by all levels with a direct verbal order, given the route of administration is within the scope of the provider. This applies to giving hydrocortisone for adrenal crisis, for instance if a patient or family member has this medication available on scene. Contact Base for direct verbal order

Feeding Tubes:

A. Feedings tubes are used for administration of medications and to provide feeds to children with an impaired ability to take oral feeds. Always ask caretaker the type of feeding tube (does the tube end in the stomach or jejunum?) and when it was placed
B. Tubes may be placed through the nose, mouth or abdomen and end in the stomach or jejunum (upper intestine)
C. Consider venting and/or gently aspirating the feeding tube in a child with respiratory or abdominal distress to allow removal of gastric contents and decompression
D. Feeding tubes that have been placed less than 6 weeks ago are not well established and may close within 1 hour of tube removal. If transport time is prolonged, place an 8 Fr suction catheter tube 2 inches into the stoma to maintain patency. Do NOT use the tube.

Tracheostomy:

A. A tracheostomy is a surgical opening between the trachea and the anterior surface of the neck. Its purpose is to bypass the upper airway for chronically ventilated patients, upper airway obstructions, or to facilitate secretion removal in those with ineffective gag or swallow reflexes.
B. Use bag-valve attached to the tracheostomy to assist ventilations if needed. May also attempt BVM with gloved finger over the tracheostomy
C. Inability to ventilate and/or signs of respiratory distress (nasal flaring, retractions, hypoxia, etc) may indicate tracheostomy obstruction. Suction tracheostomy, passing the suction catheter no further than 6 cm. Limit suctioning time to minimum amount of time necessary to accomplish effective suctioning. Oxygenate between passes with the suction catheter.
D. 0.5ml of saline may be instilled into the tracheostomy to assist suctioning of thick secretions
E. If unable to ventilate through the tracheostomy tube and patient is apneic, bradycardic, or in pulseless arrest, remove tracheostomy tube and pass an appropriately sized endotracheal tube through the stoma approximately 1-2 inches, secure and ventilate. Appropriate depth must be based upon breath sounds, as right mainstem intubation is likely.
F. Remember that caregivers are often the best people to change and suction a tracheostomy tube. Use them as your resource when possible.

Central Venous Catheters (CVCs):

A. Because of their size and location, a much greater risk of serious bacterial infections exist with CVCs compared to peripheral intravenous lines. Special care must be used when accessing such lines
B. Prior to accessing a CVC, hands should be washed and gloves worn. Vigorously scrub the CVC hub with an alcohol swab. While alcohol possesses some antimicrobial properties, the friction produced by scrubbing is the most effective
C. A port is an implanted venous central venous catheter (below the surface of the skin). These devices require a non-coring (e.g. Huber) needle for accessing and should not be accessed in the field

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
6050 PEDIATRIC UNIVERSAL RESPIRATORY DISTRESS ALGORITHM (AGE < 12 YEARS)

All patients:
- Give oxygen to all patients with respiratory distress via least distressing means, either blow-by or NRB facemask
- Minimize patient discomfort and avoid agitation. Transport in position of comfort

Inadequate ventilations?
- Place in neutral position with towel roll beneath shoulders if age <8 years
- Place oral airway if unconscious
- Assist with BVM per Assisted Ventilations Protocol

Inadequate ventilations and unable to ventilate with BVM?
- Consider ETI in a child ONLY if unable to adequately ventilate with BVM and oral airway
- Reposition airway, check technique and equipment. If still unable to oxygenate and ventilate, proceed with Oral Endotracheal Intubation Protocol

Treat specific conditions

Croup
- 6 months - 5 years w. stridor, barky cough, URI sx. Sx often rapid, nocturnal onset
- Transport in position of comfort w. parent
- Blow-by O2

For severe symptoms
- Stridor at rest, severe retractions, cyanosis, altered LOC
- Give nebulized racemic epinephrine or 1:1000 L-epinephrine

Inadequate response to treatment?
- Contact base for consult

Bronchiolitis
- Age < 2 yrs w. cough, fever, resp. distress, +/- wheezing
- Transport in position of comfort w. parent
- Blow-by O2

For severe symptoms
- Hypoxia despite O2, severe retractions, cyanosis, altered LOC
- Nasal suctioning
- Give nebulized racemic epinephrine or 1:1000 L-epinephrine

Inadequate response to treatment?
- Contact base for consult

Asthma
- EMT may administer either MDI or nebulized albuterol with base contact for verbal order

For severe symptoms
- Hypoxia despite O2, severe retractions, cyanosis, altered LOC
- Give epinephrine IM
- Give methylprednisolone IV
- Contact base for consult

For severe symptoms and inadequate response to all above treatment
- Hypoxia despite O2, severe retractions, cyanosis, altered LOC
- Give epinephrine IM
- Give methylprednisolone IV
- Contact base for consult

Consider pulmonary and non-pulmonary causes of respiratory distress in all cases:
Common: croup, bronchiolitis, asthma. Less common: foreign body aspiration, allergic reaction, pneumonia. Rare: epiglottitis, bacterial tracheitis. Also: Congenital heart disease (CHF), sepsis, other metabolic acidosis (e.g.: DKA, inborn error of metabolism)

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
6060 PEDIATRIC APPARENT LIFE-THREATENING EVENT (ALTE)

DEFINITION:
An infant < 1 year of age with episode frightening to the observer characterized by apnea, choking/gagging, color change or change in muscle tone.

Support ABCs as necessary

Obtain detailed history of event and medical history

Complete head-to-toe assessment

- Any child with an ALTE should be transported to ED for evaluation
- Monitor vital signs en route

Clinical history to obtain from observer of event:

- Document observer's impression of the infant's color, respirations and muscle tone
- For example, was the child apneic, or cyanotic or limp during event?
- Was there seizure-like activity noted?
- Was any resuscitation attempted or required, or did event resolve spontaneously?
- How long did the event last?

Past Medical History:

- Recent trauma, infection (e.g. fever, cough)
- History of GERD
- History of Congenital Heart Disease
- History of Seizures
- Medication history

Examination/Assessment

- Head to toe exam for trauma, bruising, or skin lesions
- Check anterior fontanelle: is it bulging, flat or sunken?
- Pupillary exam
- Respiratory exam for rate, pattern, work of breathing and lung sounds
- Cardiovascular exam for murmurs and symmetry of brachial and femoral pulses
- Neuro exam for level of consciousness, responsiveness and any focal weakness

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Spinal Immobilization
A. Context/Special Considerations:
   B. 60-80% of spine injuries in children occur at the cervical level
   C. Children < 8 age year are more likely to sustain high C1-C3 injuries
   D. Less force is required to injure the cervical spine in children than adults
   E. Children with Down Syndrome are at risk for cervical spine injury
   F. Avoid strapping abdomen- children are abdominal breathers
   G. Use age/size appropriate immobilization devices
   H. Proper immobilization of pediatric patients should prevent:
      1. Flexion/extension, rotation, lateral bending or axial loading of the neck (car seats do not prevent axial loading and are not considered proper immobilization technique)
      2. Non-neutral alignment or alteration in normal curves of the spine for age (consider the large occiput)
      3. Twisting, sliding or bending of the body during transport or care

Spinal Immobilization criteria:
A. Be conservative. Children are difficult to assess and “clinical clearance” criteria are not well established, as in adults
B. Immobilize the following patients as well as any child you suspect clinically may have a spine injury:
   1. Altered Mental Status (GCS < 15, AVPU < A, or intoxication)
   2. Focal neurologic findings (paresthesias, loss of sensation, weakness)
   3. Non-ambulatory patient
   4. Any complaint of neck pain
   5. Torticollis (limited range of motion, difficulty moving neck in history or physical)
   6. Substantial torso Injury (thorax, abdomen, pelvis)
   7. High Risk MVC (head on collision, rollover, ejected from the vehicle, death in the same crash, or speed > 55 m/h)
   8. Diving accident
**ADENOSINE (ADENOCARD)**

**Description**
Adenosine transiently blocks conduction through the AV node thereby terminating reentrant tachycardias involving the AV node. It is the drug of choice for AV nodal reentrant tachycardia (AVNRT, often referred to as “PSVT”). It will not terminate dysrhythmias that do not involve the AV node as a reentrant limb (e.g. atrial fibrillation).

**Onset & Duration**
- Onset: almost immediate
- Duration: 10 sec

**Indications**
- Narrow-complex supraventricular tachyarrhythmia
- Pediatric administration requires call in for direct verbal order

**Contraindications**
- Any irregular tachycardia. Specifically never administer to an irregular wide-complex tachycardia, which may be lethal
- Heart transplant

**Adverse Reactions**
- Chest pain
- Shortness of breath
- Diaphoresis
- Palpitations
- Lightheadedness

**Drug Interactions**
- Methylxanthines (e.g. caffeine) antagonize adenosine, a higher dose may be required
- Dipyridamole (persantine) potentiates the effect of adenosine; reduction of adenosine dose may be required
- Carbamazepine may potentiate the AV-nodal blocking effect of adenosine

**Dosage and Administration**

**Adult:** (Requires CALL IN and DIRECT VERBAL ORDER for EMT-I administration)
- 12 mg IV bolus, rapidly, followed by a normal saline flush.
- Additional dose of 12 mg IV bolus, rapidly, followed by a normal saline flush.
- Contact medical control for further considerations

**Pediatric:** (Requires CALL IN and DIRECT VERBAL ORDER)
- 0.2 mg/kg IV bolus (max 6 mg), rapidly followed by normal saline flush.
- Additional dose of 0.2 mg/kg (max 12 mg) rapid IV bolus, followed by normal saline flush
- Contact medical control for further considerations

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Protocol

- Adult Tachyarrhythmia with Poor Perfusion
- Pediatric Tachyarrhythmia with Poor Perfusion

Special Considerations

- Reliably causes short lived but very unpleasant chest discomfort. Always warn your patient of this before giving medication and explain that it will be a very brief sensation
- May produce bronchospasm in patients with asthma
- Transient asystole and AV blocks are common at the time of cardioversion
- Adenosine is not effective in atrial flutter or fibrillation
- Adenosine is safe in patients with a history of Wolff-Parkinson-White syndrome if the rhythm is regular and QRS complex is narrow
- A 12-lead EKG should be performed and documented, when available
- Adenosine requires continuous EKG monitoring throughout administration
ALBUTEROL SULFATE (PROVENTIL, VENTOLIN)

Description
- Albuterol is a selective β-2 adrenergic receptor agonist. It is a bronchodilator and positive chronotrope.
- Because of its β agonist properties, it causes potassium to move across cell membranes inside cells. This lowers serum potassium concentration and makes albuterol an effective temporizing treatment for unstable patients with hyperkalemia.

Onset & Duration
- Onset: 5-15 minute after inhalation
- Duration: 3-4 hours after inhalation

Indications
- Bronchospasm
- Known or suspected hyperkalemia with ECG changes (i.e.: peaked T waves, QRS widening)

Contraindications
- Severe tachycardia is a relative contraindication

Adverse Reactions
- Tachycardia
- Palpitations
- Dysrhythmias

Drug Interactions
- Sympathomimetics may exacerbate adverse cardiovascular effects.
- β-blockers may antagonize albuterol.

How Supplied
- MDI: 90 mcg/metered spray (17-g canister with 200 inhalations)
- Pre-diluted nebulized solution: 2.5 mg in 3 mL NS (0.083%)

Dosage and Administration

Adult:
- **Single Neb dose**
  Albuterol sulfate solution 0.083% (one unit dose bottle of 3.0 mL), by nebulizer, at a flow rate (6-8 lpm) that will deliver the solution over 5 to 15 minutes. May be repeated twice (total of 3 doses).
- **Continuous Neb dose**
  In more severe cases, place 3 premixed containers of albuterol (2.5 mg/3ml) for a total dose of 7.5 mg in 9 mL, into an oxygen-powered nebulizer and run a continuous neb at 6-8 lpm.

Pediatric:
- **Single Neb dose**
  Albuterol sulfate 0.083% (one unit dose bottle of 3.0 mL), by nebulizer, at a flow rate (6-8 lpm) that
will deliver the solution over 5-15 minutes. May be repeated twice during transport (total of 3 doses).

---

**Protocol**

- Asthma
- COPD
- Pediatric Respiratory Distress
- Allergy and Anaphylaxis

---

**Special Considerations**

- Consider inline nebs for patients requiring endotracheal intubation or CPAP.
- May precipitate angina pectoris and dysrhythmias
- Should be used with caution in patients with suspected or known coronary disease, diabetes mellitus, hyperthyroidism, prostatic hypertrophy, or seizure disorder
- Wheezing associated with anaphylaxis should first be treated with **epinephrine IM**.
**AMIODARONE (CORDARONE)**

**Description**
Amiodarone has multiple effects showing Class I, II, III and IV actions with a quick onset. The dominant effect is prolongation of the action potential duration and the refractory period.

**Indications**
- Pulseless arrest in patients with shock refractory or recurrent VF/VT
- Wide complex tachycardia not requiring immediate cardioversion due to hemodynamic instability

**Precautions**
- Wide complex irregular tachycardia
- Sympathomimetic toxidromes, i.e. cocaine or amphetamine overdose
- NOT to be used to treat ventricular escape beats or accelerated idioventricular rhythms

**Contraindications**
- 2nd or 3rd degree AV block
- Cardiogenic shock

**Adverse Reactions**
- Severe hypotension
- Bradycardia

**Dosage and Administration**

**Adult:**
- **Pulseless Arrest (Refractory VT/VF)**
  300 mg IV bolus.
  Administer additional 150 mg IV bolus in 3-5 minutes if shock refractory or recurrent VF/VT.
- **Symptomatic wide complex tachycardia with a pulse (CONTACT BASE)**
  150 mg IV bolus infusion over 10 minutes.

**Pediatric:**
- **Pulseless Arrest (Refractory VT/VF)**
  5mg/kg IV over 3-5 minutes. (CONTACT BASE for additional doses)

**Protocol**
- Adult Universal Pulseless Arrest Algorithm
- Pediatric Universal Pulseless Arrest Algorithm
- Adult Tachycardia with Poor Perfusion

**Special Considerations**
- A 12-lead EKG should be performed and documented, when available.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
ANTIEMETICS: ONDANSETRON (ZOFRAN), PROMETHAZINE (PHENERGAN), METACLOPRAMIDE (REGLAN)

Description
- Ondansetron is a selective serotonin 5-HT3 receptor antagonist antiemetic. Ondansetron is the preferred antiemetic, if available.
- Promethazine is a non-selective central and peripheral H-1 type histamine antagonist with anticholinergic properties resulting in antiemetic and sedative effects.
- Metaclopramide is a dopamine antagonist that works by blocking the CNS vomiting chemoreceptor trigger zone (CRT).

Indications
- Nausea and vomiting

Contraindications
- Ondansetron: none.
- Promethazine: age < 2 years, patients with respiratory or CNS depression or allergy to sulfites.
- Metaclopramide: age < 8 years or suspected bowel obstruction.

Adverse Effects:
- Ondansetron: very low rate of adverse effects, very well tolerated
- Promethazine: hypotension, CNS depression, altered mental status, pain on injection, including tissue necrosis with extravasation, extrapyramidal symptoms, urinary retention
- Metaclopramide: restlessness, agitation, extrapyramidal symptoms, sedation. Increased GI motility – do not use if suspected bowel obstruction.

Dosage and Administration

Ondansetron:
- **Adult:** 4 mg IV/IM/PO/ODT. May repeat x 1 dose as needed. EMT/EMT-IV may give ODT only and require direct verbal order.
- **Pediatric < 4 years old:** 2 mg IV/PO/ODT
- **Pediatric ≥ 4 years old:** 4 mg IV/PO/ODT

Promethazine:
- **Adult:** 6.25 mg IV/IM. May repeat x 1 dose as needed.
- **Pediatric > 2 years old:** 0.25-0.5 mg/kg IV/IM to a maximum of 6.25 mg.

Metaclopramide:
- **Adult:** 10 mg IV/IM.
7010 MEDICATIONS

Pediatric 8-12 years old:
5 mg IV/IM.

Protocol
• Abdominal Pain/Vomiting
• Altitude Illness

Promethazine and Metaclopramide Side effects/Special Notes:
• Drowsiness, dizziness, dry mouth and blurred or double vision are common.
• If hypotension occurs, administer fluid bolus.
• Dystonia and akathisia may occur, and should be treated with diphenhydramine.
• Elderly may become agitated or disoriented. Consider reducing the dose in elderly patients.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
ASPIRIN (ASA)

Description
Aspirin inhibits platelet aggregation and blood clotting and is indicated for treatment of acute coronary syndrome in which platelet aggregation is a major component of the pathophysiology. It is also an analgesic and antipyretic.

Indications
- Suspected acute coronary syndrome.

Contraindications
- Active gastrointestinal bleeding
- Aspirin allergy

How Supplied
Chewable tablets 81mg

Dosage and Administration
- 324mg PO

Protocol
- Chest Pain

Special Considerations
- Patients with suspected acute coronary syndrome taking warfarin (Coumadin) or clopidogrel (Plavix) may still be given aspirin
ATROPINE SULFATE

Description
Atropine is an endogenous antimuscarinic, anticholinergic substance. It is the prototypical anticholinergic medication with the following effects:
- Increased heart rate and AV node conduction
- Decreased GI motility
- Urinary retention
- Pupillary dilation (mydriasis)
- Decreased sweat, tear and saliva production (dry skin, dry eyes, dry mouth)

Indications
- Symptomatic bradycardia
- 2nd and 3rd degree heart block
- Organophosphate poisoning

Precautions
- Should not be used without medical control direction for stable bradycardias
- Closed angle glaucoma

Adverse Reactions
- Anticholinergic toxidrome in overdose, think "blind as a bat, mad as a hatter, dry as a bone, red as a beet"

Dosage and Administration
Hemodynamically Unstable Bradycardia
Adult:
0.5 mg IV/IO bolus.
Repeat if needed at 3-5 minute intervals to a maximum dose of 3 mg. (Stop at ventricular rate which provides adequate mentation and blood pressure)

Pediatric:
0.02 mg/kg IV/IO bolus. Minimum dose is 0.1 mg, maximum single dose 0.5 mg

Stable Bradycardia and Poisoning/Overdose
CONTACT BASE

Protocol
- Bradycardia
- Neonatal Resuscitation
- Poisoning/Overdose

Special Considerations
- Atropine causes pupil dilation, even in cardiac arrest settings

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**BENZODIAZEPINES (DIAZEPAM, LORAZEPAM, MIDAZOLAM)**

**Description**
- Benzodiazepines are sedative-hypnotics that act by increasing GABA activity in the brain. GABA is the major inhibitory neurotransmitter, so increased GABA activity *inhibits* cellular excitation. Benzodiazepine effects include anticonvulsant, anxiolytic, sedative, amnestic and muscle relaxant properties. Each individual benzodiazepine has unique pharmacokinetics related to its relative lipid or water solubility.
- Selection of specific agent as preferred benzodiazepine is at individual agency Medical Director discretion.

**Onset & Duration**
- Any agent given IV will have the fastest onset of action, typical time of onset 2-3 minutes
- Intranasal administration has slower onset and is less predictable compared to IV administration, however it may still be preferred if an IV cannot be safely or rapidly obtained. Intranasal route has faster onset compared to intramuscular route.
  - Diazepam is not absorbed well IN.
- IM administration has the slowest time of onset.

**Indications**
- Status epilepticus
- Sedation of the severely agitated/combative patient
- Sedation for cardioversion or transcutaneous pacing (TCP)
- Adjunctive agent for treatment of severe pain (e.g. back spasms) in adults that is uncontrolled by maximum opioid dose – **WITH CALL IN ONLY**

**Contraindications**
- Hypotension
- Respiratory depression

**Adverse Reactions**
- Respiratory depression, including apnea
- Hypotension
- Consider ½ dosing in the elderly for all benzodiazepines

**Dosage and Administration**

**MIDAZOLAM:**

**Seizure or sedation for cardioversion or transcutaneous pacing:**

**Adult:**
- **IV/IO route:** 2 mg
  - Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses
- **IN/IM route (intranasal preferred):** 5 mg
  - Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Pediatric:

**IV/IO route** 0.1 mg/kg
- Maximum single dose is 2 mg IV. Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses.

**IN/IM route (intranasal preferred)**: 0.2 mg/kg.
- Maximum single dose is 5 mg IN or IM. Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses.

**Sedation of severely agitated or combative patient**

**Adult:**

**IV route**: 2 mg

**IN/IM route**: 5 mg
- Dose may be repeated x 1 after 5 minutes. **Contact base** for more than 2 doses, unless **Excited Delirium Syndrome** present, in which case up to a total of 3 doses may be given as standing order in order to rapidly sedate patient.

**Pediatric:**

- **CONTACT BASE** before any consideration of sedation of severely agitated/combative child

**DIAZEPAM:**

**Seizure or sedation for cardioversion or transcutaneous pacing:**

**Adult:**

**IV/IO route**: 5 mg
- Dose may be repeated x 1 after 5 minutes. **Contact Base** for more than 2 doses.

**Pediatric:**

**IV/IO route** 0.3 mg/kg
- Maximum single dose is 5 mg IV. Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses.

**Sedation of severely agitated or combative patient**

**Adult:**

**IV route**: 5 mg
- Dose may be repeated x 1 after 5 minutes. **Contact base** for more than 2 doses, unless **Excited Delirium Syndrome** present, in which case up to a total of 3 doses may be given as standing order in order to rapidly sedate patient.

**Pediatric:**

- **CONTACT BASE** before any consideration of sedation of severely agitated/combative child

**LORAZEPAM:**

**Seizure or sedation for cardioversion or transcutaneous pacing:**

**Adult:**

**IV/IO route**: 1 mg

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

- Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses

**IN/IM route (intranasal preferred):** 2 mg
- Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses

**Pediatric:**
- **IV route:** 0.05 mg/kg
  - Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses

**IN/IM route (intranasal preferred):** 0.1 mg/kg
- Dose may be repeated x 1 after 5 minutes if still seizing. **Contact Base** for more than 2 doses

**Sedation of severely agitated or combative patient**

**Adult:**
- **IV route:** 2 mg
- **IN/IM route** 2 mg
  - Dose may be repeated x 1 after 5 minutes. **Contact base** for more than 2 doses, unless **Excited Delirium Syndrome** present, in which case up to a total of 3 doses may be given as standing order in order to rapidly sedate patient

**Pediatric:**
- **CONTACT BASE** before any consideration of sedation of severely agitated/combative child

---

**Protocol**

- Synchronized Cardioversion
- Transcutaneous Pacing
- Adult Seizure
- Pediatric Seizure
- Pediatric tachycardia with poor perfusion
- Agitated/Combative Patient
- Poisoning/Overdose

---

**Special Considerations**

- All patients receiving benzodiazepines must have cardiac, pulse oximetry monitoring during transport. Continuous waveform capnography recommended.
- Sedative effects of benzodiazepines are increased in combination with opioids, alcohol, or other CNS depressants.
- Coadministration of opioids and benzodiazepines is discouraged and may only be done with direct physician verbal order.
- In elderly patients > 65 years old or small adults < 50kg, lower doses may be sufficient and effective. Consider ½ dosing in these patients.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
CALCIUM GLUCONATE

Description
• Cardioprotective agent in hyperkalemia.
• 10% calcium gluconate solution contains 1 g calcium gluconate per 10 mL, which is only 90mg of elemental calcium.
• Doses below refer to dose of calcium gluconate solution, not elemental calcium.

Indications
• Adult pulseless arrest associated with any of the following clinical conditions:
  o Known hyperkalemia
  o Renal failure with or without hemodialysis history
  o Calcium channel blocker overdose
• **Not indicated for routine treatment of pulseless arrest**
• Adult or pediatric calcium channel blocker overdose with hypotension, bradycardia

Contraindications
• Known hypercalcemia
• Suspected digoxin toxicity (i.e. digoxin overdose)

Side Effects/Notes
• Must give in separate line from IV sodium bicarb to prevent precipitation/formation of calcium carbonate
• Extravasation may cause tissue necrosis
• In setting of digoxin toxicity, may worsen cardiovascular function

Dosage and Administration
Adult:
• **Pulseless arrest assumed due to hyperkalemia:**
  o 1 g slow IV push
• **Calcium channel blocker overdose:**
  o **Contact base** for order. 1 g slow IV/IO push over 2-3 minutes. Dose may be repeated every 10 minutes for total of 3 doses
Pediatric:
• **Calcium channel blocker overdose:**
  o **Contact Base.** 60 mg/kg (0.6 mL/kg), not to exceed 1 g slow IV/IO push, may repeat every 10 minutes for total of 3 doses

Protocol
• Adult Universal Pulseless Arrest ALS Algorithm
• Poisoning/Overdose

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

DEXTROSE

Description
Glucose is the body's basic fuel and is required for cellular metabolism. A sudden drop in blood sugar level will result in disturbances of normal metabolism, manifested clinically as a decrease in mental status, sweating and tachycardia. Further decreases in blood sugar may result in coma, seizures, and cardiac arrhythmias. Serum glucose is regulated by insulin, which stimulates storage of excess glucose from the blood stream, and glucagon, which mobilizes stored glucose into the blood stream.

Indications
- Hypoglycemia
- The unconscious or altered mental status patient with an unknown etiology.

Precautions
- None

Dosage and Administration
**Adult:**
- 25 gm (50 ml of a 50% solution) IV/IO bolus

**Pediatric:**
- 1-8 years: 2-4 ml/kg of a 25% solution
- <1 year: 2-4 ml/kg of a 10% solution

Protocol
- Universal Altered Mental Status
- Seizures
- Poisoning/Overdose
- Psych/Behavioral
- Neonatal Resuscitation

Special Considerations
- The risk to the patient with ongoing hypoglycemia is enormous. With profound hypoglycemia and no IV access consider IO insertion.
- Draw blood sample before administration if possible.
- Use glucometer before administration, if possible.
- Extravasation may cause tissue necrosis; use a large vein and aspirate occasionally to ensure route patency.
- Dextrose can be irritable to the vein and the vein should be flushed after administration.
- Dextrose should be diluted 1:1 with normal saline (to create D_{50}W) for patient 1-8 years old.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

**DIPHENHYDRAMINE (BENADRYL)**

**Description**
Antihistamine for treating histamine-mediated symptoms of allergic reaction. Also Anticholinergic and antiparkinsonian effects used for treating dystonic reactions caused by antipsychotic and antiemetic medications (e.g.: haloperidol, droperidol, compazine, etc).

**Indications**
- Allergic reaction
- Dystonic medication reactions or akathisia (restlessness)

**Precautions**
- Asthma or COPD, thickens bronchial secretions
- Narrow-angle glaucoma

**Side effects**
- Drowsiness
- Dilated pupils
- Dry mouth and throat
- Flushing

**Drug Interactions**
- CNS depressants and alcohol may have additive effects.
- MAO inhibitors may prolong and intensify anticholinergic effects of antihistamines.

**Dosage and Administration**

**Adults:**
50 mg IV/IO/IM

**Pediatrics:**
<8 years: 1-2 mg/kg slow IV/IO/IM (not to exceed 50 mg)

**Protocol**
Allergy/Anaphylaxis
7010 MEDICATIONS

DROPERIDOL (INAPSINE)

Description
- Droperidol is a butyrophenone derivative closely related to haloperidol. Droperidol produces a dopaminergic blockage, a mild alpha-adrenergic blockage, and causes peripheral vasodilation. Its major actions are sedation, tranquilization, and potent anti-emetic effect.

Onset & Duration
- Onset: 3-10 minutes after IM administration.
- Duration: 2-3 hours

Indications
- Primary use for management of agitated/combative patients.
- Second line medication for management of intractable vomiting requiring base contact.
- Combative head injured patients.

Contraindications
- Any patient with:
  - Suspected acute myocardial infarction/ACS
  - Systolic blood pressure under 100 mm/Hg, or the absence of a palpable radial pulse
  - Signs of respiratory depression

Side Effects
- Due to the vasodilation effect, droperidol can cause a transient hypotension that is usually self limiting and can be treated effectively with leg elevated position and IV fluids. Droperidol may cause tachycardia which usually does not require pharmacologic intervention.
- Some patient’s may experience unpleasant sensations manifested as restlessness, hyperactivity, or anxiety following droperidol administration.
- Extra-pyramidal reactions have been noted hours to days after treatment.
- Rare instances of neuroleptic malignant syndrome have been known to occur following treatment using droperidol.

Dosage and Administration

Agitation/Combative
Adult:
IV/IM route: 5.0 mg slow IV/IM administration, after 10 minutes if desired effect is not achieved contact base to consider a second dose. Pediatric:

Under the age of 12 Contact Base

Antiemetic: Contact base for orders
  - IV/IM route:
  - Adult: 1.25 mg slow push.
  - Pediatric: 0.05 mg/kg slow push.

Special Considerations

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

- Due to droperidol’s potential effect on QT interval prolongation, all patients receiving droperidol should be placed on the cardiac monitor. Though it is understood that obtaining an ECG on the combative or agitated patient may be difficult, every effort should be made to do so.
- Avoid droperidol in frail or elderly patients due to increased risk of prolonged and over-sedation as well as increased risk of hypotension and prolonged QT. If it must be given, administer ½ typical dose.

Protocol
- Agitated/Combative Patient Protocol
7010 MEDICATIONS

EPINEPHRINE (ADRENALIN)

Description
Endogenous catecholamine alpha, beta-1, and beta-2 adrenergic receptor agonist. Causes dose-related increase in heart rate, myocardial contractility and oxygen demand, peripheral vasoconstriction and bronchodilation.

Indications
- Pulseless Arrest
- Anaphylaxis
- Asthma
- Bradycardia with poor perfusion

Adverse Reactions
- Tachycardia and tachydysrhythmia
- Hypertension
- Anxiety
- May precipitate angina pectoris

Drug Interactions
- Should not be added to sodium bicarbonate or other alkaloids as epinephrine will be inactivated at higher pH.

Dosage and Administration
Adult:
- **Pulseless Arrest**
  1 mg (10 mL of a 1:10,000 solution), IV/IO bolus.
  Repeat every 3-5 minutes.
- **Bradycardia with hypotension and poor perfusion refractory to other interventions**
  Continuous infusion titrated to effect: see 7010 Vasopressor infusion
- **Asthma:**
  0.3 mg (0.3 mL of a 1:1,000 solution) IM. May repeat dose x 1.
- **Systemic allergic reaction:**
  0.3 mg (0.3 mL of a 1:1,000 solution) IM. May repeat dose x 1.
- **Severe systemic allergic reaction (Anaphylaxis) refractory to IM epinephrine:**
  Continuous infusion titrated to effect: see 7010 Vasopressor infusion
- **ALTERNATIVE to racemic epinephrine:** (for epiglottitis, miscellaneous causes of stridor)
  5 mL of 1:1000 epinephrine via nebulizer x 1

Epinephrine Auto-Injector:
- **Systemic allergic reaction:**
  Adult: 0.3 mg IM with autoinjector (adult EpiPen, Auvi-Q)
  Pediatric: 0.15 mg IM with autoinjector (EpiPen Jr., Auvi-Q)

Pediatric:
- **Cardiac arrest:**
  0.01 mg/kg IV/IO (0.1 mL/kg of 1:10,000 solution).
  Subsequent doses repeated every 3-5 min: 0.01 mg/kg IV/IO (0.1 mL/kg of 1:10,000 solution) **Bradycardia (CONTACT BASE)**
  0.01 mg/kg (0.1 mL/kg of 1:10,000 solution) IV/IO
- **Asthma**
  0.01 mg/kg (0.01 mL/kg of 1:1,000 solution) IM

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

Moderate to Severe Allergic Reactions
0.01 mg/kg (0.01 mL/kg of 1:1,000 solution) IM

Severe systemic allergic reaction (Anaphylaxis) refractory to IM epi (Contact Base):
0.01 mg/kg (0.1 mL/kg of 1:10,000 solution) IV/IO

ALTERNATIVE to racemic epinephrine: (for bronchiolitis, croup, epiglottitis, miscellaneous causes of stridor)
5 mL of 1:1000 epinephrine via nebulizer x 1

Protocol
- Adult Universal Pulseless Arrest Algorithm
- Pediatric Pulseless Arrest ALS Algorithm
- Adult Bradycardia
- Neonatal Resuscitation
- Allergy and Anaphylaxis Protocol
- Bradycardia with Poor Perfusion
- Pediatric Respiratory Distress
- 7010 Vasopressor Infusion

Special Considerations
- May increase myocardial oxygen demand and angina pectoris. Use with caution in patients with known or suspected CAD
**FUROSEMIDE (LASIX)**

**Description**
Rapid acting, potent loop diuretic; inhibits reabsorption of sodium chloride. It is also a venous dilator that decreases preload and causes venous pooling and subsequent hypotension.

**Indications**
- Cardiogenic Pulmonary Edema and only with prolonged transport times (>30 min)

**Contraindications**
- Pregnancy
- Dehydration or shock

**Side Effects**
- Hypotension

**Dosage and Administration**
20-80 mg IV bolus. Patients not on Lasix should receive 20 mg. Patients taking lasix chronically should receive higher doses in the 40-80 mg range

**Protocol**
CHF/Pulmonary edema
**GLUCAGON**

**Description**
Increases blood sugar concentration by converting liver glycogen to glucose. Glucagon also causes relaxation of smooth muscle of the stomach, duodenum, small bowel, and colon.

**Onset & Duration**
- Onset: variable

**Indications**
- Altered level of consciousness where hypoglycemia is suspected and IV access is unavailable.
- Hypotension, bradycardia from beta-blocker or calcium channel overdose.

**Side Effects**
- Tachycardia
- Headache
- Nausea and vomiting

**Dosage and Administration**

**Adult:**
- Hypoglycemia 1.0 mg, IM
- Beta Blocker/Calcium Channel overdose 2.0 mg IV bolus (AEMT and EMT-I Contact Base)

**Pediatric:**
- Hypoglycemia 0.1 mg/kg IM. Maximum dose 1.0 mg
- Beta Blocker/Calcium Channel overdose 2.0 mg IV bolus (AEMT and EMT-I Contact Base)

**Protocol**
- Seizure
- Poisoning/Overdose
- Hypoglycemia

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
HALOPERIDOL (HALDOL)

Description
Haloperidol is a dopamine antagonist antipsychotic medication. Haloperidol produces a dopaminergic blockade, a mild alpha-adrenergic blockade, and causes peripheral vasodilation. Its major actions are sedation and tranquilization.

Onset & Duration
• Onset: Within 10 minutes after IM administration. Peak effect within 30 minutes
• Duration: 2-4 hours (may be longer in some individuals)

Indications
• Sedation of a severely agitated combative patient

Contraindications
• Suspected myocardial infarction
• Hypotension
• Respiratory or CNS depression
• Pregnancy
• Children < 8 years old

Precautions
• Haldol may cause hypotension, tachycardia, and prolongation of the QT interval. Use with caution in severe cardiovascular disease.
• Cardiac monitor and establish an IV as soon as possible with all administrations.
• Some patients may experience unpleasant sensations manifested as restlessness, hyperactivity, or anxiety following haloperidol administration.
• Rare instances of neuroleptic malignant syndrome (very high fever, muscular rigidity) have been known to occur after the use of haloperidol.

Dosage and Administration
Adults and Pediatrics > 8 years old
5 - 10 mg IM

BASE CONTACT must be made for additional doses (consider if no effects within 10 minutes)

Special Considerations
• Extra-pyramidal reactions have been noted hours to days after treatment, usually presenting as spasm of the muscles of the tongue, face, neck, and back. This may be treated with diphenhydramine.
• Hypotension and tachycardia secondary to haloperidol are usually self-limiting and should be treated with IV fluid bolus.
• Use reduced dose in patients age ≥ 65

Protocol
Agitated/Combative Patient Protocol

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
HYDROXYCOBALAMIN (CYANOKIT)

Description
- Cyanide inhibits cytochrome oxidase, thereby arresting cellular respiration and forcing anaerobic metabolism, which leads to lactate production and acidosis. Hydroxycobalamin binds cyanide ions to form cyanocobalamin which is excreted in urine.

Indications
- Adult or pediatric patient with suspected cyanide poisoning from any route, including smoke inhalation in an enclosed space, with any of the following clinical signs:
  - Pulseless arrest
  - Coma/unresponsiveness
  - Signs of shock

Precautions
- Administer only after basic life support measures have been initiated and always in conjunction with other supportive treatment modalities

Adverse Reactions
- Hypertension
- Allergic reaction/anaphylaxis

Dosage and Administration
- **Adult** dose is 5 gm IV
- **Pediatric** dose is 70mg/kg up to 5 gm IV
  - Cyanokit consists of either a single 5 gm vial or 2 x 250 mL vials each containing 2.5 gm of hydroxycobalamin.
  - Single 5 gm vial Instructions:
    1. Reconstitute: Place the vial in an upright position. Add 200 mL of 0.9% Sodium Chloride Injection* to the vial using the transfer spike. Fill to the line. *0.9% Sodium Chloride Injection is the recommended diluent (diluent not included in the kit). Lactated Ringer's Solution and 5% Dextrose Injection have also been found to be compatible with hydroxocobalamin.
    2. Mix: The vial should be repeatedly inverted or rocked, not shaken, for at least 60 seconds prior to infusion.
    3. Infuse Vial: Use vented intravenous tubing, hang and infuse desired dose over 15 minutes.
  - 2 x 2.5 gm vials instructions:
    1. Reconstitute: Add 100 mL of 0.9% Sodium Chloride Injection* to the vial using the transfer spike. Fill to the line.
    2. Mix: The vials should be repeatedly inverted or rocked, not shaken, for at least 30 seconds prior to infusion.
    3. Infuse 1st vial: Use vented intravenous tubing, hang and infuse desired dose over 7.5 min.
    4. Infuse 2nd vial (repeat steps 1 and 2 before 2nd infusion) to desired dose over 7.5 min.

Special Considerations
- It is understood that Cyanokit may not be available to all agencies at all times and therefore is not considered standard of care. Notify receiving facility if Cyanokit used.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review July 2016
IPRATROPIUM BROMIDE (ATROVENT)

Description
Ipratropium is a anticholinergic antimuscarinic bronchodilator chemically related to atropine.

Onset & Duration
- Onset: 5-15 min. after inhalation
- Duration: 6-8 hr. after inhalation

Indications
- Bronchospasm

Contraindications
- Do not administer to children < 2 years
- Soy or peanut allergy is a contraindication to use of Atrovent metered dose inhaler, not the nebulized solution, which does not have the allergen contained in propellant

Adverse Reactions
- Palpitations
- Tremors
- Dry mouth

How Supplied
Premixed Container: 0.5 mg in 2.5ml NS

Dosage and Administration

Adult
Bronchospasm:
Ipratropium (0.5 mg/2.5 ml) along with albuterol in a nebulizer

Child (2yrs – 12yrs)
Mod and Severe Bronchospasm
Ipratropium (0.5 mg/2.5 ml) along with albuterol in a nebulizer
Not indicated for repetitive dose or continuous neb use

Protocol
- Asthma
- COPD
- Pediatric Respiratory Distress

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
LIDOCAINE 2% SOLUTION

Description
Local anesthetic for relief of pain during intraosseous fluid administration.

Indications
• Analgesic for intraosseous infusion

Side Effects
• Seizures
• Drowsiness
• Tachycardia
• Bradycardia
• Confusion
• Hypotension

Precautions
• Lidocaine is metabolized in the liver and therefore, elderly patients and those with liver disease or poor liver perfusion secondary to shock or congestive heart failure are more likely to experience side effects

Dosage and Administration
0.5 mg/kg IO bolus, slowly, maximum dose is 50 mg

Protocol
Intraosseous Administration

Special Notes
• Seizure from lidocaine toxicity likely to be brief and self-limited. If prolonged, or status epilepticus, treat per seizure protocol
• Treat dysrhythmias according to specific protocol
MAGNESIUM SULFATE

Description
Magnesium sulfate reduces striated muscle contractions and blocks peripheral neuromuscular transmission by reducing acetylcholine release at the myoneural junction. In cardiac patients, it stabilizes the potassium pump, correcting repolarization. It also shortens the Q-T interval in the presence of ventricular arrhythmias due to drug toxicity or electrolyte imbalance. In respiratory patients, it may act as a bronchodilator in acute bronchospasm due to asthma or other bronchospastic diseases. In patients suffering from eclampsia, it controls seizures by blocking neuromuscular transmission and lowers blood pressure as well as decreases cerebral vasospasm.

Indications
Antiarrhythmic
• Torsade de pointes associated with prolonged QT interval
Respiratory
• Severe bronchospasm unresponsive to continuous albuterol, ipratropium, and IM epinephrine.
Obstetrics
• Eclampsia: Pregnancy > 20 weeks gestational age or post partum with seizures

Precautions
• Bradycardia
• Hypotension
• Respiratory depression

Adverse Reactions
• Bradycardia
• Hypotension
• Respiratory depression

Dosage and Administration
• Torsades de Pointes suspected caused by prolonged QT interval:
  • 2 gm, IV bolus.
• Refractory Severe Bronchospasm:
  • 2 gm, IV bolus, over 2 minutes CONTACT BASE for order.
• Eclampsia:
  • 2 gm, IV bolus slowly
  • Mix 4 gm, diluted in 50 ml of Normal Saline (0.9 NS), IV drip over 15-30 minutes.

Protocol
• Adult Universal Pulseless Arrest Algorithm
• COPD
• Asthma
• Obstetric Complications

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**METHYPREDNISOLONE (SOLU-MEDROL)**

**Description**
Methyprednisolone is a synthetic steroid that suppresses acute and chronic inflammation and may alter the immune response. In addition, it potentiates vascular smooth muscle relaxation by beta-adrenergic agonists and may alter airway hyperactivity.

**Indications**
- Anaphylaxis
- Severe asthma
- COPD
- Suspected Addisonian crisis (cardiovascular collapse in patient at risk for adrenal insufficiency)

**Contraindications**
- Evidence of active GI bleed

**Adverse Reactions**
Most adverse reactions are a result of long-term therapy and include:
- Gastrointestinal bleeding
- Hypertension
- Hyperglycemia

**Dosage and Administration**

**Adult:**
- 125 mg, IV/IO bolus, slowly, over 2 minutes

**Pediatric:**
- 2 mg/kg, IV/IO bolus, slowly, over 2 minutes to max dose of 125 mg

**Protocol**
- Asthma
- Allergy and Anaphylaxis
- Chronic Obstructive Pulmonary Disease
- Adult hypotension/shock
- Adrenal Insufficiency

**Special Considerations**
- Must be reconstituted and used immediately
- The effect of methylprednisolone is generally delayed for several hours.
- Methylprednisolone is not considered a first line drug. Be sure to attend to the patient’s primary treatment priorities (i.e. airway, ventilation, beta-agonist nebulization) first. If primary treatment priorities have been completed and there is time while in route to the hospital, then methylprednisolone can be administered. Do not delay transport to administer this drug

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
NALOXONE (NARCAN)

Description
Naloxone is a competitive opioid receptor antagonist

Onset & Duration
Onset: Within 5 minutes
Duration: 1-4 hours

Indications
• For reversal of suspected opioid-induced CNS and respiratory depression
• Coma of unknown origin with impaired airway reflexes or respiratory depression

Adverse Reactions
• Tachycardia
• Nausea and vomiting
• Pulmonary Edema

Dosage and Administration
Adult:
0.5 mg IV/IO/IM/IN and titrate to desired effect, up to 2 mg total
In cases of severe respiratory compromise or arrest, 2 mg bolus IV/IO/IM is appropriate, otherwise drug should be titrated

Pediatrics:
0.5 mg IV/IO/IM/IN and titrate to desired effect, up to 2 mg total

Protocol
• Universal Altered Mental Status Protocol
• Poisoning/Overdose

Special Considerations
• Not intended for use unless respiratory depression or impaired airway reflexes are present. Reversal of suspected mild-moderate opioid toxicity is not indicated in the field as it may greatly complicate treatment and transport as narcotic-dependent patients may experience violent withdrawal symptoms
• Patients receiving naloxone must be transported to a hospital

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

NITROGLYCERINE (NITROSTAT, NITROQUICK, etc)

Description
Short-acting peripheral venodilator decreasing cardiac preload and afterload

Onset & Duration
Onset: 1-3 min.
Duration: 20-30 min.

Indications
• Pain or discomfort due to suspected Acute Coronary Syndrome
• Pulmonary edema due to congestive heart failure

Contraindications
• Suspected right ventricular ST-segment elevation MI (Inferior STEMI pattern plus ST elevation in right sided-precordial leads)
• Hypotension SBP < 100
• Recent use of erectile dysfunction (ED) medication (e.g. Viagra, Cialis)

Adverse Reactions
• Hypotension
• Headache
• Syncope

Dosage and Administration
0.4 mg (1/150 gr) sublingually or spray, every 5 minutes
PRN up to a total of 3 doses for persistent CP.

Nitropaste: system specific protocol

Protocol
• Adult Chest Pain
• CHF/Pulmonary Edema

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
**OPIOIDS (FENTANYL, MORPHINE, HYDROMORPHONE)**

**Description**

Opioid analgesics with desired effects of analgesia, euphoria and sedation as well as undesired effects of respiratory depression and hypotension. A synthetic opioid, fentanyl is 100 times more potent than morphine, and is less likely to cause histamine release.

**Indications**

- Treatment of hemodynamically stable patients with moderate to severe pain due to traumatic or medical conditions, including cardiac conditions, abdominal pain, back pain, etc.
- Treatment of shivering after therapeutic induced hypothermia (TIH).

**Contraindications**

- Hypotension, hemodynamic instability or shock
- Respiratory depression

**Caution/Comments:**

- Opioids should only be given to hemodynamically stable patients and titrated slowly to effect.
- The objective of pain management is not the removal of all pain, but rather, to make the patient’s pain tolerable enough to allow for adequate assessment, treatment and transport.
- Respiratory depression, including apnea, may occur suddenly and without warning, and is more common in children and the elderly. **Start with ½ traditional dose in the elderly.**
- Coadministration of opioids and benzodiazepines is discouraged and may only be done with direct physician verbal order.
- Chest wall rigidity has been reported with rapid administration of fentanyl.

**Dosage and Administration**

**FENTANYL:**

- Adult doses may be rounded to nearest 25 mcg increment
- Initial dose in adults typically 100 mcg
- Strongly consider ½ typical dosing in elderly or frail patient

**Adult:**

**IV/IO route:** 1-2 mcg/kg.
- Dose may be repeated after 5 minutes and titrated to clinical effect to a maximum cumulative dose of 3 mcg/kg
- Additional dosing requires BASE CONTACT

**IN route:** 1-2 mcg/kg.
- Dose may be repeated after 5 minutes after initial IN dose to a maximum cumulative dose of 3 mcg/kg. IV route is preferred for repeat dosing.
- Additional dosing requires BASE CONTACT

**Pediatric (1-12 years):**

**IV/IO route:** 1-2 mcg/kg.
- Dose may be repeated after 5 minutes and titrated to clinical effect to a maximum cumulative dose of 3 mcg/kg.
- Additional dosing requires BASE CONTACT

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

IN route: 1-2 mcg/kg.

- Administer a maximum of 1 mL of fluid per nostril
- Dose may be repeated after 5 minutes after initial IN dose to a maximum cumulative dose of 3 mcg/kg. IV route is preferred for repeat dosing.
- IN route requires BASE CONTACT and approval for any patient < 5 years old, or any patient < 12 years old with indication other than isolated orthopedic injury or burns

Pediatric < 1 year: BASE CONTACT

MORPHINE:

Adult:

IV/IO/IM routes: 5 mg.

- Dose may be repeated after 10 minutes and titrated to clinical effect to a maximum cumulative dose of 10 mg.
- Additional cumulative dosing > 10 mg requires BASE CONTACT.
- Morphine may not be given IN as it is poorly absorbed

Pediatric (1-12 years):

IV/IO/IM routes: 0.1 mg/kg. Maximum single dose is 10 mg

- Dose may be repeated after 10 minutes and titrated to clinical effect up to maximum cumulative dose of 0.2 mg/kg or 10 mg.
- Additional cumulative dosing requires BASE CONTACT.
- Morphine may not be given IN as it is poorly absorbed

Pediatric < 1 year: BASE CONTACT

HYDROMORPHONE:

Adult:

IV/IO/IM routes: 0.5 mg

- Dose may be repeated after 10 minutes and titrated to clinical effect up to maximum cumulative dose of 1.5 mg.
- Additional cumulative dosing requires BASE CONTACT.

Pediatric 1-12 years and ≥ 10kg:

IV/IO/IM routes: 0.2 mg

- Repeat dosing requires BASE CONTACT.

Pediatric < 1 years or < 10kg:

IV/IO/IM routes: with verbal order only. BASE CONTACT for any administration

NOTE: IV route is preferred for all opioid administration because of more accurate titration and maximal clinical effect. IO/IN/IM are acceptable alternatives when IV access is not readily available. Repeat doses of IN Fentanyl can be given if IV access cannot be established. However greater volumes and repeat IN administration are associated with greater drug run off and may therefore be less effective. Continuous pulse oximetry monitoring is mandatory. Frequent evaluation of the patient’s vital signs is also indicated. Emergency resuscitation equipment and naloxone must be immediately available.

## 7010 MEDICATIONS

### ORAL GLUCOSE (GLUTOSE, INSTA-GLUCOSE)

**Description**
Glucose is the body's basic fuel and is required for cellular metabolism

**Indications**
- Known or suspected hypoglycemia and able to take PO

**Contraindications**
- Inability to swallow or protect airway
- Unable to take PO meds for another reason

**Administration**
One full tube 15 g buccal.

**Protocol**
- Universal Altered Mental Status Protocol
- Hypoglycemia
7010 MEDICATIONS

OXYGEN

Description
Oxygen added to the inspired air increases the amount of oxygen in the blood, and thereby increases the amount delivered to the tissue. Tissue hypoxia causes cell damage and death. Breathing, in most people, is regulated by small changes in the acid-base balance and CO\textsubscript{2} levels. It takes relatively large decreases in oxygen concentration to stimulate respiration.

Indications
- Suspected hypoxemia or respiratory distress from any cause
- Acute chest or abdominal pain
- Hypotension/shock states from any cause
- Trauma
- Suspected carbon monoxide poisoning
- Obstetrical complications, childbirth

Precautions
- If the patient is not breathing adequately, the treatment of choice is assisted ventilation, not just oxygen.
- When pulse oximetry is available, titrate SpO\textsubscript{2} to ≥ 90%. This may take some time.
- Do not withhold oxygen from a COPD patient out of concerns for loss of hypoxic respiratory drive. This is never a concern in the prehospital setting with short transport times

Administration

<table>
<thead>
<tr>
<th>Flow</th>
<th>LPM Dosage</th>
<th>Indications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Flow</td>
<td>1-2 LPM</td>

<td>Moderate Flow</td>
<td>3-9 LPM</td>
<td>Moderate medical / trauma</td>
</tr>
<tr>
<td>High Flow</td>
<td>10-15 LPM</td>
<td>Severe medical / trauma</td>
</tr>
</tbody>
</table>

Special Notes
- Do not use permanently mounted humidifiers. If the patient warrants humidified oxygen, use a single patient use device.
- Adequate oxygenation is assessed clinically and with the SpO\textsubscript{2} while adequate ventilation is assessed with clinically and with ETCO\textsubscript{2}.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
PHENYLEPHRINE (INTRANASAL)

Description
Used for topical nasal administration, phenylephrine primarily exhibits alpha adrenergic stimulation. This stimulation can produce moderate to marked vasoconstriction and subsequent nasal decongestion.

Indications
• Prior to nasotracheal intubation to induce vasoconstriction of the nasal mucosa
• Nose bleed

Precautions
• Avoid administration into the eyes, which will dilate pupil

Dosage and Administration
• Instill two drops of 1% solution in the nostril prior to attempting nasotracheal intubation
• Administer 2 sprays in affected naris in patient with active nosebleed after having patient blow nose to expel clots.

Protocol
• Nasotracheal intubation
• Epistaxis
RACEMIC EPINEPHRINE

Description
Racemic epinephrine 2.25% is an aqueous solution that delivers 11.25 mg of racemic epinephrine per 0.5mL for use by oral inhalation only. Inhalation causes local effects on the upper airway as well as systemic effects from absorption. Vasoconstriction may reduce swelling in the upper airway, and β effects on bronchial smooth muscle may relieve bronchospasm.

Onset & Duration
- Onset: 1-5 minutes
- Duration: 1-3 hours

Indications
- Bronchospasm in bronchiolitis
- Stridor at rest in croup
- Suspected epiglottitis in adults or children

Side Effects
- Tachycardia
- Palpitations
- Muscle tremors

Dosage and Administration
0.5 ml racemic epinephrine (acceptable dose for all ages) mixed in 2 ml saline, via nebulizer at 6-8 LPM to create a fine mist and administer over 15 minutes.

Protocol
- Pediatric Respiratory Distress

Special Considerations
- Racemic epi is heat and photo-sensitive
- Once removed from the refrigerator, the unopened package is stable at room temperature until the expiration date stated on the package.
- Do not confuse the side effects with respiratory failure or imminent respiratory arrest.
SODIUM BICARBONATE

Description
Sodium bicarbonate is an alkalotic solution, which neutralizes acids found in the body. Acids are increased when body tissues become hypoxic due to cardiac or respiratory arrest.

Indications
- Tricyclic overdose with arrhythmias, widened QRS complex, hypotension, seizures
- Suspected hyperkalemic pulseless arrest: consider in patients with renal failure

Contraindications
- Metabolic and respiratory alkalosis
- Hypocalcemia
- Hypokalemia

Adverse Reactions
- Metabolic alkalosis
- Hyperosmolarity may occur, causing cerebral impairment

Drug Interactions
- May precipitate in calcium solutions.
- Alkalization of urine may increase half-lives of certain drugs.
- Vasopressors may be deactivated.

Dosage and Administration
Adults and children (>10 kg), 8.4%
Tricyclic OD with hypotension or prolonged QRS > 0.10 sec or suspected hyperkalemia-related pulseless arrest:
- 1 mEq/kg slow IV push
- Repeat if needed in 10 minutes

Protocol
- Adult Universal Pulseless Arrest Algorithm
- Poisoning/Overdose

Special Considerations
- Sodium bicarbonate administration increases CO₂ which rapidly enters cells, causing a paradoxical intracellular acidosis.
- Sodium bicarb is no longer recommended for routine use in prolonged cardiac arrest. Its use in pulseless arrest should be limited to known or suspected hyperkalemia (e.g. dialysis patient).

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
7010 MEDICATIONS

TOPICAL OPHTHALMIC ANESTHETICS

Description
Used for topical administration as a pain reliever for eye irritation. Only proparacaine and tetracaine are approved for use.

Indications
- Pain secondary to eye injuries and corneal abrasions
- Topical anesthetic to facilitate eye irrigation

Contraindications
- Known allergy to local anesthetics
- Globe lacerations or rupture

Precautions
- Transient burning/stinging when initially applied

Dosage and Administration
Instill two drops into affected eye. Repeat only with Base Contact and physician consult

Protocol
- May be used for the above listed indications as needed

Special Considerations
- This is single patient use. Unused portions are to be discarded and only new bottles are to be used.
- Do not administer until patient consents to transport and transport has begun
- Topical ophthalmic anesthetics should never be given to a patient for self-administration

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
VASOPRESSOR CONTINUOUS INFUSION – ADULT PATIENTS ONLY

Description:

**Epinephrine:** Preferred vasopressor for all indications.
- Endogenous catecholamine alpha, beta-1, and beta-2 adrenergic receptor agonist. Causes dose-related increase in heart rate, myocardial contractility and oxygen demand, peripheral vasoconstriction and bronchodilation

**Dopamine:** may be used as an alternative vasopressor for indications of hypotension or bradycardia, but not for anaphylaxis or status asthmaticus.
- Endogenous catecholamine chemically related to epinephrine and norepinephrine. Increases blood pressure through combination of dopamine, alpha and beta receptor effects leading to increased heart rate, contractility and peripheral vasoconstriction.

Indications:

**Epinephrine:**
- Severe Allergic Reaction/Anaphylaxis
- Hypotension with malperfusion refractory to adequate fluid resuscitation (typically 30 mL/kg crystalloid)
- Bradycardia with signs of poor perfusion
- Respiratory distress due to severe asthma refractory to other treatments

**Dopamine:**
- Hypotension with malperfusion refractory to adequate fluid resuscitation (typically 30 mL/kg crystalloid)
- Bradycardia with signs of poor perfusion

Contraindications:

- Do not use vasopressor infusion in PEDIATRIC patients

Adverse Reactions

- Dysrhythmia
- Hypertension
- Anxiety
- Angina

Drug Interactions

- Do not add to sodium bicarbonate or other alkaloids as epinephrine will be inactivated at higher pH.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
Dosage and Administration:

Epinephrine:
- **Mix:** inject 1 mg epinephrine into 1000 mL Normal Saline bag to achieve 1mcg/mL concentration (This means 1 mL of 1:1000 or 10 mL of 1:10,000 – either way 1 mg of drug). Use macro drip set.
- **Adult IV/IO:** Begin IV/IO infusion wide open to gravity. Titrate to desired hemodynamic effect with goal BP of > 90 mmHg systolic, improved respiratory status (bronchodilation), and improved perfusion/mentation. Typical volume are less than 100 mL of fluid total, as typical doses are expected to be < 100 mcg.

Dopamine:
- **Mix:** 400 mg in 250 mL NS or 800 mg in 500 mL NS to produce concentration of 1600 mcg/mL.
- **Adult IV/IO:** 2-20 mcg/kg/min, Start at 5 mcg/kg/min, Titrate dose up 5 mcg/kg/min every 5 min to a max of 20 mcg/kg/min to desired hemodynamic effect.

Protocol
- 2025 Adult Post-Resuscitation Care Following Pulsless Arrest with ROSC
- Adult Bradycardia
- Allergy and Anaphylaxis Protocol
- Bradycardia with Poor Perfusion
- Medical Hypotension/Shock
- Overdose and Acute Poisoning
- Therapeutic Induced Hypothermia after Cardiac Arrest

Special Considerations
- May increase myocardial oxygen demand and angina pectoris. Use with caution in patients with known or suspected CAD.

Approved by Denver Metro EMS Medical Directors July 1, 2015. Next review January 2016
8010 Quick Reference for Procedures and Medications Allowed by Protocol

This list does not include Medical Director specific waivers or base contact requirements. It is assumed that not all agencies will necessarily stock all medications.
